1.0 INTRODUCTION

In response to one of the conditions of the Minister of the Environment's Certificate of Determination on the Environmental Assessment of the Irving Oil Limited (IOL) Refinery Upgrade Project in 1999, IOL participated in a Public Health Risk Assessment (PHRA) which was undertaken by the Department of Health and Community Services in relation to the refinery operation. The PHRA of the IOL Refinery Upgrade recommended validation and follow-up be undertaken.

Subsequently, IOL's Air Quality Approval (I-4904) was issued, and included a condition related to the PHRA as follows:

"The Approval Holder shall participate in a process to validate the assumptions of the Public Health Risk Assessment of the Refinery Upgrade Project (PHRA) to be undertaken by the Department of Health and Wellness and to be completed by September 30, 2006."

The date for completion of the validation study has subsequently been extended.

1.1 Task Definition

The assignment is to carry out a comprehensive study to validate the assumptions made in the PHRA, following the steps outlined in Table 1.1. The work plan included the collection of existing data, which is reasonably available as per the Request for Proposal (RFP), from the New Brunswick Department of Environment (NBENV), the National Pollutant Release Inventory (NPRI) and IOL. The work plan did not include further data collection and assembly or the preparation of addendums to the PHRA. The study was directed by a Steering Committee established by the client, which is Co-Chaired by representatives of the Departments of Environment and Health and Wellness, and whose membership includes residents of Saint John, representatives from Irving Oil, and the City of Saint John.

While pursuing the Validation Study, AMEC found that the available data and methodology used in the PHRA was insufficient to allow a valid opinion with regard to the comparison of the pre- and post-upgrade refinery operation with respect to the health risk of VOCs. After consultation with the client, it was determined that an addendum to the work outlined in Table 1.1 was warranted, and AMEC was asked to perform a ***de novo health risk assessment for ambient VOCs (inhalation route only)***.

In performing the Validation Study, AMEC, pursuant to its discussions and agreement with the Steering Committee, has focused its efforts on relevant environmental data both pre- and post-refinery upgrade, rather than on assessing any methodology issues with regard to the original ***Public Health Risk Assessment***, nor with regard to the air quality modeling which was performed in order to enable the original assessment. In addition, the Steering Committee directed that a "Methodology Report" be prepared which would indicate AMEC's approach to the

Table 1.1 Validation/Data Sources

Validation Step	Primary Data Sources	
Verify stack concentrations of Polycyclic Aromatic Hydrocarbons (PAHs) and metals are low following the upgrade.	Stack Tests on new sources including Flue Gas Scrubber (FGS), Sulphuric Acid Tail Gas Unit (SATGU) and Sulphuric Acid Regeneration Unit (SARU). Stack tests for metals also available for existing heavy fuel sources.	DOE
Fugitive emissions from the IOL Refinery should be characterized for specific Volatile Organic Compounds (VOCs) to enable assessment of the assumptions in the PHRA regarding these emissions (i.e. the VOC emissions will not significantly increase). This need not to be an extensive program. Initial characterization of the hydrocarbons from the IOL fugitive emission abatement program would provide information that would be applicable for air dispersion modelling to provide estimates for ground level air concentrations of the VOCs from this source in the community. This information could then be used to eliminate the uncertainties in the estimation of potential health risks, or odours, related to fugitive emissions could be evaluated by interpolation of the specific VOC analyses with the hydrocarbon analysis to eliminate specific VOCs as necessary.	Ambient VOC monitoring results at Forest Hills and Champlain Heights School for 13 and 5 years respectively. Comparative data from Point Lepreau available.	DOE
With respect to the evaluation of existing ambient chemical loads in the Saint John area, site specific ambient concentrations of Methyl, Tertiary, Butyl, Ether (MTBE) were unavailable. Therefore, MTBE concentrations used in the existing ambient scenario were based on concentrations found in ambient air in 3 cities with refineries in the US. Since MTBE is a combustion product from vehicles and is used to a limited extent at the IOL Refinery, levels of MTBE in ambient air should be confirmed.	Ambient MTBE monitoring results at Forest Hills and Champlain Heights School. IOL MTBE emissions data.	DOE NPRI
A wide range of parameters should be monitored after start-up of the IOL Refinery Upgrade to confirm the following:		
<ul style="list-style-type: none"> • Stack emission rates for Sulphur Dioxide (SO₂), Nitrogen Oxides (NO_x), Carbon Monoxide (CO) and Total Suspended Particulate (TSP) (and particulate breakdown); if there is a substantial change in the estimated versus measured rates for these substances then the results of the risk assessment would need to be re-evaluated. 	Monthly and annual reports. Stack tests. Continuous Emission Monitors (CEM) data.	DOE
<ul style="list-style-type: none"> • Analyse stack emissions of TSP to characterize the PAH profile in the emissions to assess the validity of the TSP: PAH ratios used in the PHRA. The conclusions of the PHRA depend on these ratios although they were derived from ambient PAH data (including all sources of PAH, such as diesel truck traffic), and therefore are considered to over-estimate PAH emission from the IOL Refinery Upgrade. If the ratios used prove invalid, an addendum to the 	Stack Tests on new sources including FGS, TGU and SARU. Limited ambient TSP monitoring results as well as several years of PM _{2.5} and PM ₁₀ monitoring.	DOE

Table 1.1 Validation/Data Sources

Validation Step	Primary Data Sources	
PHRA should be prepared using the additional information.		
<ul style="list-style-type: none"> • Verify ambient ground level air concentrations of SO₂ and particulate estimates once the IOL Refinery Upgrade is operational. • Evaluate the validity of the SO₂: NO_x and SO₂: CO ratios used, and modify PHRA as necessary (following the same rationale as outlined above for PAHs). 	Ambient SO ₂ (5+ stations) and particulate (2+ stations) monitoring results. Stack tests for new and existing equipment. Ambient monitoring results for NOX at 3+ stations.	DOE IOL
An appropriate odour monitoring, similar to that conducted historically, should be conducted once the upgrade is operational. This program should be linked and coordinated with the fugitive emission monitoring and analysis program outlined above for VOCs.	Odour observation tours and complaint files.	DOE IOL
The IOL program in place for training staff and bringing the new technologies in the upgrade on line should be communicated with the public to address concerns regarding possible failures, and resulting impacts of various kinds on the community should bring the upgrade on-line fail.	Annual reports. Community Liaison Committee, Newsletters, Notification letters, Community Connections, Open Houses. Other documented programs carried out by IOL.	DOE IOL
Due to the lack of qualitative data related to upset the accident scenarios, and the concerns raised by the public in this area, an assessment of these issues should be conducted.		
IOL should focus on improved communication with the public regarding their maintenance, and resulting emergency-response programs. Lack of information about the operation of the refinery promote feelings and concerns by the public related to lack of control over their lives, and fears about the operation of the refinery next to their neighbourhoods. These issues raise concerns of psychosocial effects on their health that then foster distrust and complaints about the operation of the refinery. The implementation of a Public Health Management Program, as discussed below, would provide a means for improved communication with the public.		
Noise levels are not expected to change once the Upgrade is operational. However, an appropriate program, such as that conducted historically, should be implemented to monitor noise from the upgraded facility so that an appropriate noise management program can be implemented if required.	Complaints. Noise level monitoring results. Reports prepared by Irving Oil.	DOE IOL
It is not expected that the intensity of light emissions from the refinery will change once the upgrade is operational. This conclusion should be verified, and if night time light levels change significantly as a result of the upgrade and this poses concern to local residents, options to mitigate this problem should be identified and implemented.	Complaints	DOE IOL

task at hand. AMEC prepared and submitted a document outlining its proposed approach, and following comments and further discussion, a final "Methodology Report" was accepted and is attached as Appendix A. In general, with some variation which will be described, the validation study was based on Table 1.1 as described in the proposal.

1.2 Background

In August of 1998, pursuant to IOL's registration of its intent to substantially upgrade its Saint John refinery, the New Brunswick Minister of the Environment, under the authority of the New Brunswick Environmental Impact Assessment Regulation, issued a Certificate of Determination (Appendix B) (which was later amended in March of 2000). The Certificate included the requirement that:

"The proponent must participate in a public health risk assessment in relation to the refinery operation undertaken by the Department of Health and Community Services and be completed by September 30, 1999. The cost of the study will be funded by the Department of Health and Community Services and fully recovered from the proponent."

The PHRA was prepared by Cantox Environmental Inc., and the 'Final Technical Document' was submitted in December, 1999. As noted in Section 1, the Air Quality Approval (I-4904), which superseded I-2091, subsequently required that the assumptions used in the PHRA be validated following experience with the operation of the upgraded refinery.

1.3 Objective

The overall objective of this project is to help ensure that the *"Public Health Risk Assessment of the Irving Oil Refinery Upgrade in Saint John, NB"* (PHRA) based its risk assessment conclusions on appropriate environmental data, both previously monitored, as well as forecast. The health risk methodology used is assumed to be appropriate, although, as noted, a supplemental assessment of health risks from VOCs (inhalation route only) has been completed as part of this report. The air quality modeling, performed to allow for the completion of the PHRA, has not been validated as part of this exercise; however, it has been previously reviewed, and further independent modeling led to comparable results within reasonable limits.

2.0 AIR QUALITY

2.1 Emission Data Analysis

As per discussions with the Steering Committee, it was agreed that all emissions data would be obtained from the Department of the Environment, in order to ensure a consistent focal point for communications and to verify that the data had been accepted as valid by the Department. Wherever possible, the emissions data has been placed in the context of comparison to both applicable conditions of IOL's Air Quality Approval, as well as to the assumptions which were used to develop the PHRA. In addition, the post-upgrade emissions have been compared to the pre-upgrade emissions. In this analysis, unless otherwise noted, pre-upgrade emissions reflect the period from January 1996 to December 1999, post-upgrade being January 2000 to December 2006.

2.1.1 Sulphur Dioxide (SO₂) Emissions

Table 2.1 indicates, in a summary form, the total SO₂ emissions from the IOL refinery, both for the pre- and post-upgrade eras, as well as the PHRA's assumed annual emissions and related Air Quality Approval limits. An emission data set for individual units is contained in electronic format under separate cover as Appendix C.

The data indicates that the PHRA used as its basis (for modeling purposes) an annual emission rate which was projected to be up to 29% less than the pre-upgrade quantity. The actual data from the post-upgrade era indicates that SO₂ emissions have decreased by some 18%. Therefore, one can infer that the air quality basis for the PHRA's considerations of health risk is somewhat optimistic; nonetheless, a significant reduction in emissions was realized. However, it must be noted that one would have to consider the changes in source parameters in order to be more certain of potential changes in air quality. Nevertheless, the assumptions that SO₂ emissions would decrease were sound, and IOL's intended implementation of a new Hydrogenation Amine Tail Gas Unit in 2008 is expected to reduce annual emissions by a further amount of approximately 1000 tonnes per year (a reduction of some 19%, based on current emissions).

Table 2.1 IOL Annual Sulphur Dioxide (SO₂) Emissions (tonnes/year)

Years	Reported Annual Average Emissions (tonnes/year)	PHRA Basis (tonnes/year)
Jan/96-Dec/99	6560	
Jan/00-Dec/06	5384	4899
Oct/00-Sept/05		
Oct/05-Sept/09		

2.1.2 Nitrogen Oxides (NO_x) Emissions

Table 2.2 indicates, in a summary form, the emissions of NO_x from both the pre- and post-upgrade IOL facility, as well as the total projected emissions which formed the basis for the PHRA. The PHRA assumed that NO_x emissions from the IOL facility would increase by some 28.5% (meaning an increase of 21.1% from the combined industrial facilities as considered for modeling purposes). The actual increase in NO_x emissions has been in the order of an average of 37.1%, thus one would expect the models to somewhat underestimate downwind impacts (keeping in mind, however, that dispersion models tend to more significantly overestimate ground level impacts, and that source parameters may not be as predicted).

Table 2.2 IOL Annual Nitrogen Oxides (NO₂) Emissions (tonnes/year)

Years	Emissions (Tonnes /Year)	PHRA Assumption
May/96-Dec/99	3280	
Jan/00-Dec/06	4500	4214

2.1.3 Carbon Monoxide (CO) Emissions

Table 2.3 presents the CO emissions as averaged for the pre- and post-upgraded refinery. The PHRA based its ambient air quality assessment on the assumption that IOL's CO emissions would increase by some 37%. However, as indicated, the actual average annual increase which has occurred is of the order of 30%. Thus, the CO emissions basis was conservative.

Table 2.3 IOL's Annual Emissions of CO (tonnes/year)

Years	Emissions	PHRA
May/96-Dec/99	1047	
Jan/00-Dec/06	1360	1435

2.1.4 Total Suspended Particulate Emissions (TSP)

Table 2.4 presents the TSP emissions as reported for both the pre- and post-upgraded IOL refinery. As can be seen, the average TSP emissions are virtually unchanged over the time periods considered. Since the PHRA used mathematical relationships in deriving PM_{2.5} as well as PM₁₀ emission data, both of which were based on TSP data, neither of these parameters, as used for the health assessment, will have changed significantly. The modeling used by the PHRA assumed a substantial (88%) increase in TSP emissions; however, emissions data indicates that TSP emissions have remained constant, at a level some 6% less than modeled for. Nonetheless, the actual ground level impacts, derived through modeling, are dependent on source parameters, as well as the aerodynamics of the particles themselves.

Table 2.4 TSP Emissions (tonnes/year)

Years	Emissions	PHRA
Jan/98-Dec/99	442	251
Jan/00-Dec/06	442	470

2.1.5 Fugitive Volatile Organic Compounds (VOCs)

Table 2.5 gives a summary of the fugitive VOCs as emitted by the IOL refinery, both pre- and post-upgrade. It should be noted that fugitive VOC emissions are generally the result of the leakage of materials through seals, flanges, valves, etc. Modern refineries (indeed, all process industries), such as IOL, have instituted vigorous maintenance procedures in order to minimize leaks to the environment, in order to protect workers, nearby residents, and to maintain equipment in proper working order. Naturally, measurements taken just prior to, as well as just after maintenance procedures, represent the worst and best cases for emission reduction respectively. The data in Table 2.5 reflects the summary of the average of the two cases for the pre- and post-upgrade era. As can be seen, fugitive VOC emissions decreased by approximately 39%. A complete data set for fugitive VOC emissions is included as part of an electronic database appended to this report, as Appendix D. It should be noted that the fugitive VOC emission data do not include those from the tank farm or the loading rack.

Table 2.5 IOL Annual Average Fugitive VOC Emissions (tonnes/year)

Years	Emissions
1996-1999	204
2000-2006	124

2.2 Ambient Data Analysis

2.2.1 Sources of Data

Further to discussion with and direction from the Steering Committee, it was agreed that all ambient air quality data would be obtained from/through the Department of the Environment. This was done in order to ensure that there was a focal point for communication, as well as to ensure that the data was considered by the Department to be of acceptable quality for the validation exercises. In order to present some further context for the ambient air quality in the vicinity of the IOL Refinery, additional annual average air quality data is presented for a number of randomly selected Canadian urban sites. These data have all been extracted from Environment Canada's National Air Pollution Surveillance Network (NAPS).

As mentioned previously, the ambient air quality impact of the refinery has been modeled (dispersion modeling), and this work has been independently confirmed. The PHRA identified and described the following scenarios:

1. **Existing Ambient Scenario:** Evaluation of the potential exposures to ambient concentrations of emissions in various areas of the communities based on the current ambient air monitoring data collected near the IOL Refinery.
2. **Existing Study Area Scenario:** Evaluation of the potential exposures of the selected receptors to predicted ground level concentrations of emissions from industrial sources near the refinery, including the IOL Refinery in its present state (i.e., without the upgrade.)
3. **Future Study Area Scenario:** Evaluation of the potential exposures of the selected receptors to predicted future ground level air concentrations of emissions from industrial sources near the refinery, including the IOL Refinery following the upgrade.
4. **Background Scenario:** All of the emissions considered in this assessment can be found within the environment, independent of their presence in emissions from the IOL Refinery Upgrade, either from natural sources or other sources related to a wide range of human activities (e.g., residential heating, other industries, vehicle exhaust, long range transport of air pollution from other locations). The sole purpose of the inclusion of an assessment of this background scenario was to provide a benchmark or reference for comparison to the assessment of results from other scenarios.

Scenarios 2 and 3 include the modeled contributions of the Irving Oil Refinery, the Courtenay Bay Power Plant, and the Irving Paper Mill.

2.2.2 Pre- and Post-Upgrade Results

The tables contained within Sections 2.2.3 to 2.2.10 present the ambient monitoring results for the pollutants under consideration, as well as typical results from some other Canadian cities (Appendix E contains specific information for these sites, which fall under the National Air Pollution Surveillance Network (NAPS)). (Note: The selection of the ‘typical’ monitoring sites was primarily based on which ones which yielded reportable data for most, if not all of the pollutants being considered.) In addition, information for the modeling scenarios is included for context, although actual monitored data is preferable in validating the outcome of the PHRA.

The air quality objectives noted in the tables are those adopted by New Brunswick, and are representative of Canadian “Acceptable” Objectives, or Canada-Wide Standards, except for SO₂, which New Brunswick has established as 50% of the Canadian Objective for the Saint John Region (Saint John, Charlotte and Kings Counties).

2.2.3 Ambient Sulphur Dioxide (SO₂)

The ambient air quality for SO₂ is presented in Table 2.6, which shows ambient monitoring statistics for both the pre- and post-upgrade time periods, as well as some typical results from other Canadian cities.

Table 2.6 Ambient Sulphur Dioxide (SO₂)

⁴ NAQO = National Air Quality Objectives

The PHRA report indicates that only maximum SO₂ concentrations were available from the modeling results, and that they are considered to be both conservative by nature, as well as a possible “*result from the predicted coincidence of SO₂ emissions with highly infrequent meteorological conditions*”. Thus, the ambient measurements of pre- and post-upgrade SO₂ represent the best possible method of considering whether the basis for the PHRA assessment was suitable.

As can be seen, at the Forest Hills location there is little change in the 50th percentile figure, nor in the 95th percentile figure. In fact, there is a small decrease in both results, as well as in the maximum one hour concentration. The same trend holds true for the Champlain Heights monitor, with the exception that the one hour maximum is significantly higher (in 2005), and indeed represents an exceedence of the New Brunswick one hour SO₂ Objective of 450 ug/m³. *These New Brunswick Objectives are for the three county area in Southern New Brunswick, and are twice as stringent as the Objectives for the rest of the province.* The Three Mile Irving, Silver Falls and Forest Products monitors show similar patterns, with the latter two also indicating maximums which exceed the Objective; however, the Forest Products location had a higher one hour maximum in the pre-upgrade era. Given the post-upgrade range of 95th percentile results (5-102 ug/m³) it is likely that the elevated maximum one hour concentrations are representative of ‘outliers’ which occurred due to source upset conditions and/or unusual meteorological factors.

The 24 hour averages depicted in Table 2.6 yield a similar conclusion, in that the 95th percentile results, as well as three of the five 50th percentile results are lower for the post-upgrade years, and substantially lower than the modeled results for both scenarios. Once again, some of the maximum 24 hour results exceeded the New Brunswick Objective (150 ug/m³).

The annual averages for all of the stations show post-upgrade reductions in SO₂ concentrations, and are all significantly below the New Brunswick Objective (30 ug/m³), as well as far lower than the modeled scenarios. Although one must be cautious when there are multiple sources involved, one might expect the decreases in annual averages given the significant reduction in SO₂ emissions from a major source (i.e. IOL), having gone from some 6560 tonnes/year to an average of 5384 tonnes/year. Nonetheless, given changes in refinery source configuration, source parameters, meteorological conditions, as well as the unknown changes to the other industries, one cannot make an absolute direct linkage to improved air quality. However, with reference to SO₂, one can conclude that the future scenario used for the PHRA was a conservative one (i.e. it assumed higher concentrations than actually experienced.)

Table 2.6E portrays the number of monitored exceedences of the 1-hour and 24-hour objectives for SO₂ at the Forest Hills, Champlain Heights, and Silver Falls sites for the years 1996-2005. As can be seen, the one-hour objective is rarely exceeded at these sites, and there does not appear to be any particular trend for the entire period, both pre- and post-upgrade. However, the 24-hour objective indicates a number of exceedences, with Silver Falls indicating the most frequent number of excursions, but again there is no clear trend indicated. It is worth noting that

a 24-hour exceedence is based on each 'rolling 24-hour period', so that every calendar day has 24 data points for both the one-hour objective as well as the 24-hour objective. This factor tends to skew the 24-hour data, in that a few one-hour levels which are relatively high (but below the one-hour objective) may cause the 24-hours objective to be exceeded several times before the 'averaging' function will bring it back down below limits.

Table 2.6M indicates a measure of the SO₂ 1-hour and 24-hour exceedences which were both modeled and monitored at Forest Hills, Silver Falls and Champlain Heights for the years 2000, 2001 and 2002. As can be seen, the two model runs (as reported by *MGI, IOL Refinery Upgrade PHRA and Follow-up, Saint John Refinery, Saint John, New Brunswick, Feb/2005*), performed by Stantec and CRA, predicted numerous exceedences of both the 1-hour ambient objective as well as the 24-hour objective. However, the number of actual exceedences as monitored (see Table 2.6E) was far fewer, again highlighting the conservative nature of modeled results.

2.2.4 Ambient Nitrogen Dioxide (NO₂)

The ambient air quality data for NO₂ are shown in Table 2.7. The dispersion modeling scenarios had indicated that both the 24 hour 95th percentile and the annual means would increase slightly post-upgrade. Considering the change in modeling inputs in isolation, this would appear to be consistent with the fact that the PHRA assumed that "*The net increase at the stack (as opposed to at ground level) will be roughly 28.5% over existing conditions*". When considering the NO₂ contributions from Courtenay Bay Power Plant (CB) and Irving Paper (IP)

⁴ NAQO = National Air Quality Objectives

Mill), the overall increase in emission rates is 21.1%. In fact, the actual increase in average annual refinery NO_x emissions post-upgrade appears to be approximately 37.1%. The models also assumed a linear relationship between the downwind concentrations of NO_x and SO₂ which, while being a reasonable approach, would not take into account the differences between the two pollutants in terms of atmospheric reactivity. Additionally, the lack of significant change in the ambient levels may well reflect changes in the other two industrial sources, and/or the significant impact of other sources (eg. traffic, domestic space heating).

Nevertheless, the assumptions adopted by the PHRA in using the two modeling scenarios appear to be reasonable. Thus, any health risk methodology used for NO₂, given the differences in the upgrade's NO_x emissions, would likely approximate the impact of the upgrade. Furthermore, all of the NO₂ data indicate values which are well below the relevant New Brunswick Air Quality Objectives (1-hour/400 ug/m³, 24-hour/200 ug/m³, and annual/100 ug/m³).

2.2.5 Ambient Carbon Monoxide (CO)

Table 2.8 presents the (available) data for CO, as well as the modeled results from the PHRA. The relative lack of data for CO may, in fact, reflect the fact that ambient levels are generally well below the standard (National Acceptable Air Quality One Hour Objective is 35,000 ug/m³). The models indicated a relatively modest increase in CO, based upon expected increases in stack emissions from sources within IOL. Additionally, the contribution (modeled) of the three industrial sources, pre- and post-upgrade, is small when compared to typical levels found in an urban environment. This is likely due to the more closely linked contribution from vehicles, domestic heating, or small commercial enterprises, as well as to 'background' levels. Although the lack of monitored data prevents an actual assessment of changes to ambient CO in the vicinity of the refinery, the conclusion by the PHRA (*"This worst case approach would result in an increase of the ambient ground level CO concentrations from 2600 ug/m³ 95th% of 1-hr averaging time by 37.1% to 3565 ug/m³."*) This would still be in the range of only 10% of the New Brunswick Objective.

2.2.6 Ambient PM₁₀

The ambient air quality data for PM₁₀ are shown in Table 2.9. Given the relative paucity of measured data, the PHRA relied on the modeling scenarios, and their generally conservative outcomes (i.e. calculated ground level contributions from the source(s) considered are generally higher than would actually occur) for its analysis. Additionally, the model for PM₁₀ used TSP emissions as a surrogate, based on the formula:

$$PM_{10} = 10^{(0.826 \times \log TSP)}$$

As indicated in Table 2.9, the expected (i.e. modeled) increases in the upgraded refinery's contribution to PM₁₀ would range from 7.5-11%, based on the 24-hour, 95th percentile. More importantly, using the 24-hour 95th percentile (1997) for Forest Hills, one can estimate that the

⁴ The PM10 standard of 50 ug/m³ is accepted and used in the Greater Vancouver Regional District and in Newfoundland, and has been applied here as New Brunswick does not have a standard for PM10.

increase in 24-hour 95th percentile ambient concentrations from the three industrial sources would be in the order of 0.7-1.6%, although this would assume that the 95th percentiles remain approximately the same. Thus, although the outcomes cannot be definitively validated, it is reasonable to expect that the ambient changes in PM₁₀, if any, would be marginal, justifying the PHRA's basis for health risk analysis. The expected ambient PM₁₀ levels would be well below the most common objectives/standards in general use presently (50 ug/m³ – 24-hour), although New Brunswick has, at present, established no objective.

2.2.7 Ambient PM_{2.5} (and Sulphates)

The ambient PM_{2.5} levels, as well as the modeled scenarios are shown in Table 2.10. As with the modeling of the PM₁₀ emissions, the PHRA assessment based the PM_{2.5} emissions on a calculation which, in this case, used the formula:

$$PM_{2.5} = 10^{(0.636 \times \log TSP)}$$

As can be seen, the estimated impact of the upgrade on the refinery's contributions is, once again, small when compared to the actual ambient levels. The increases in the 24-hour 95th percentile were modeled at between, 0.1-0.2 ug/m³ for the three locations used in the PHRA assessment, or in the range of 0.5% of the impact from the three industrial sources combined.

As was noted in the PHRA, "...it must be recognized that the PM_{2.5} values used in the...assessment were based on values calculated from total suspended particulate matter, and were not actually measured values. Therefore, the...conclusions are contingent on validation of the PM_{2.5} concentrations in the community." The 24-hour 95th percentile measurements from 2000-2006 for Forest Hills would indicate that the basis for the PHRA conclusion was justified, and the annual means over the same period further bolster the validation of the assumptions used. Indeed, the mean of the annual PM_{2.5} averages for the period 2000-2006 is 5.4 ug/m³, whereas the mean for 1997 at Forest Hills was 6.4 ug/m³.

Given the lack of data on sulphates, as well as the PHRA's use of the formula:

$$[SO_4^{2-}] = -0.33 + 0.37*[PM_{2.5}]$$

as cited from Environment Canada, it is likely that, on the evidence of minimal changes in PM_{2.5}, the conclusion that the IOL upgrade "...would not likely have measurable adverse health outcomes on public health in the community" with respect to sulphate concentrations is well-founded.

2.2.8 Ambient Total Suspended Particulates (TSP)

The ambient TSP data (pre-upgrade) as well as the modeled scenarios are shown in Table 2.11. TSP (total suspended particulate) has generally diminished in its use as an air quality indicator; since evidence has evolved that the finer particulates (PM₁₀-“inhalable”, PM_{2.5}-“respirable”) are more closely linked to human health effects. Thus, there are no relevant

⁴ CWS is the Canada Wide Standards

⁵ The annual average is the arithmetic mean of monthly averages. Geometric mean could not be calculated due to lack of original data.

ambient statistics for TSP in the area of concern for the post-upgrade era. However, given the results of the PM₁₀ and the PM_{2.5} ambient data, and the fact that the (conservative) modeling scenarios used TSP as the basis for estimating PM₁₀ and PM_{2.5}, one would expect that the modeling results for TSP would also yield higher TSP numbers than would actually be experienced. Thus, the impact of the upgraded refinery would show changes in the 24-hour 95th percentile of between 0.3 ug/m³ and 1.1 ug/m³ for the three sites shown, and of less than 1 ug/m³ for each of the three sites. Since the New Brunswick Objectives for 24-hours and Annual averages are 120 ug/m³ and 70 ug/m³, respectively, one would expect that the basis for predicting no adverse health effects is accurate. The PHRA goes further in that it examines the modeled impact making an assumption that all of the TSP (at these sites) is due to the refinery operations. Even in this case, the expected annual average TSP would not exceed the Objective of 70 ug/m³.

2.2.9 Ambient Ozone (O₃)

The monitoring data for O₃ is shown in Table 2.12, as well as the data from some typical Canadian cities, and the national "Acceptable Air Quality Objective" of 82 ppb (1 hour average). (Note: The Canada-Wide Standard for O₃ has been established as a 'numeric' of 65 ppb, 8-hour averaging time, achievement based on the 4th highest annual measurement, averaged over three years, with achievement by 2010. General provisions are included to allow for trans-boundary influences.)

As is mentioned in the PHRA, 'background' ambient air concentrations of O₃ range from 20-50 ppb, thus, long range transport of both O₃ and its precursors is an important factor for any region which lies downwind of highly populated and industrialized areas. In terms of the IOL upgrade project, while its emissions of NO_x (a precursor for O₃ formation) have shown some increase (as predicted), its fugitive VOC emissions have gone down substantially (approximately 39%). Although no modeling was done to predict downwind impacts on O₃ levels, the PHRA suggests that "*It is considered unlikely that the estimated change at ground level (of NO₂) (14 to 18.3% increase) would significantly impact on the production of ground level ozone and the subsequent accumulation of photochemical smog in the Saint John Region.*" Given the fact that the emissions of NO₂ increased less than anticipated, and that ambient levels of O₃ have not changed, the basis for the PHRA's risk analysis appears to be sound.

2.2.10 Ambient Polycyclic Aromatic Hydrocarbons (PAHs)

With respect to PAHs, the PHRA was based on ambient data as well as formulated relationships to TSP levels. While there may be some lack of clarity as to the overall basis for the PHRA with respect to ambient air quality, its conclusion that the IOL upgrade would not be expected to adversely impact public health (with respect to PAHs) appears to be supported by both the ambient data shown in Table 2.13, as well as by the stack tests done for IOL in 2004, which indicated low emission rates for PAHs from both the *Residue Fluid Catalytic Cracking Unit* stack as well as from the *Sulphuric Acid Regeneration Unit* stack.

2.3 Odour Assessment

A review of logged concern calls to IOL and NBENV show that odour is the number one complaint of residents living in close proximity to the Refinery. The logged concern calls from 2003 to 2006 indicate that 42 to 61 % of all calls in a given year are related to odours. The PHRA indicated that approximately 41% of all calls logged by the NBENV 24 hour Air Quality Response Program from 1995 to 1997 were regarding odour. However, it should be noted that not all odour complaints can be attributed to the Refinery, as there are other potential sources of odour in East Saint John. In addition, due to privacy issues, AMEC was not provided with a list of people who made the concern calls, therefore it is possible that more than one phone call could be placed by the same individual regarding the same odour issue.

Odour has been difficult to measure and control as different chemicals have differing odour thresholds and individuals have differing sensitivities to various odours. The Department of the Environment began daily odour tours at 12 different monitoring stations. Two additional monitoring stations were added in 2002. From 1997 to May 2002, the number of times a particular odour was encountered at a monitoring station was recorded. There was no ranking system used to indicate the degree of odour (i.e. faint versus strong).

The dominant odours noted in 1997 to early 2002 were heavy oil, light oil, light ends, wood, smoke and IOL treatment ponds. The results are plotted in Figure 2.1, below. The 2002 odour tour data was missing some information (the 'total tours with each odour') and therefore could not be compared to the 1997-2001 data.

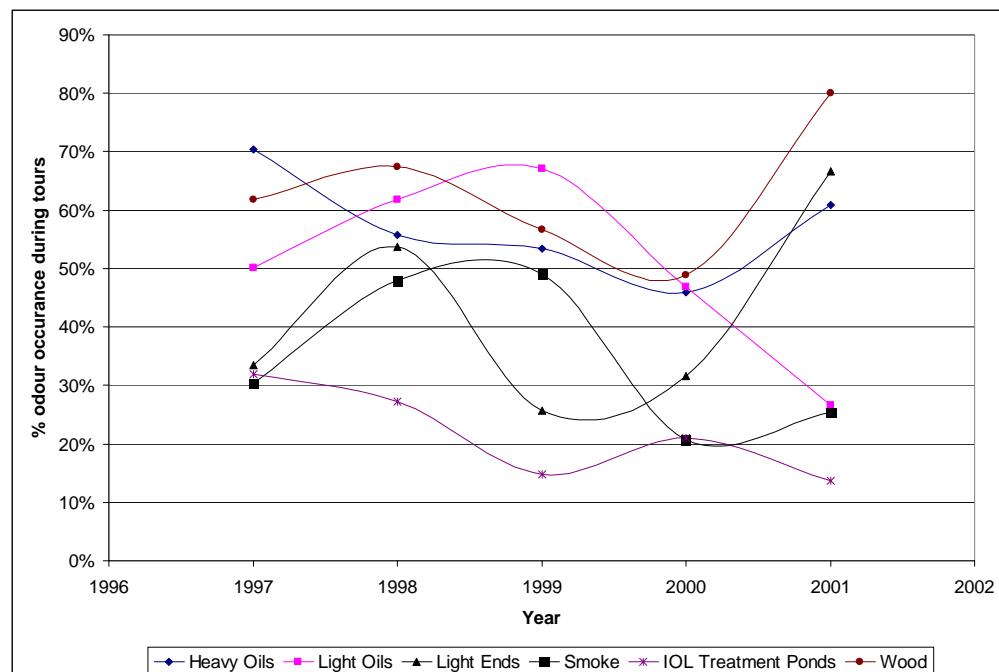

Figure 2.1 Results of Refinery Odour Tours from 1997 - 2001

In general, it was found that heavy oil odour was encountered in 46 to 70% of all odour tours at one or more monitoring locations. Wood odours were encountered in 49 – 80% of tours, light oil odours from 27-62% of tours, light ends in 26-67% of tours, smoke in 21-49% of tours, and IOL treatment pond odours in 14-32% of tours. Septic and sour water odours were also detected in a smaller percentage of tours. Based on the data, it appears as though the IOL treatment pond odours may be decreasing, however the remaining odour types do not show a definitive trend.

The PHRA refers to a “mean odour index” calculated for data collected as part of the 24 hour air quality emergency program. The PHRA indicates a mean odour index of 1.7 (between fair to good, and poor) between 1995 and 1997, and 2.5 (fair to poor) for 1998. The method of calculating the mean odour index was not described in the PHRA report or the supporting documents, therefore this method could not be used to assess pre-upgrade odours to post-upgrade odours.

Further, post upgrade monitoring was completed daily from June 2002 to the present. Readings in this time period were recorded using a different method from the 1997 to early 2002 measurements. Similar to the pre-upgrade, odours were categorized as effluent, wood, sulphur, heavy oil, light oil, light ends, septic, exhaust, smoke, chemical, and other. The odour categories are defined in Table 2.14, below.

Table 2.14 Odour Category Descriptions

Term	Definition
Air Quality	The highest ranking of the different odour categories
Effluent	Treatment ponds, industrial waste
Wood	Irving Paper wood chips, etc.
Sulphur	Mercaptans, rotten egg smell (H2S)
Heavy Oil	Bunker, residuals, asphalt
Light Oil	Gasoline
Light Ends	Vapours
Septic	Sewage
Exhaust	Burning of fossil fuels (flares, boiler stacks, vehicle emissions)
Smoke	Burning of woodwaste, garbage (typically woodstoves)
Chemical	Ammonia, chlorine, toluene, acetone, MTBE
Other	All other scents not described above
Comments	Further odour details

Odours at each station are categorized then ranked from 1 to 5 depending on the severity of the odour, where 1 is equal to no odour and 5 is very strong. The ranking system is described in Table 2.15, below.

A separate column called “Air Quality” is used to record the highest ranking of all the odour categories. For instance if an area has a heavy oil odour with a ranking of 3, a wood ranking of 1, and a smoke odour with a ranking of 2, the overall Air Quality ranking for that station is 3. Wind direction and other important weather information are also recorded to assess whether the odour is coming from the direction of the refinery.

Table 2.15 Ranking System Used for Odour Measurements (2002-Present)

Ranking	Definition
1	No odour detected (very good)
2	Faint odour (good)
3	Notable odour - easily detected (fair)
4	Distinct and strong odour (poor)
5	Very strong odour - overwhelming (very poor)

The PHRA predicted that the incidence of heavy oil odours would decrease as a result of the reduction in production of Bunker C following the upgrade. Due to the differences in the method used to collect data, it is difficult to directly compare the odour data from 1997-2001 to the 2002-2007 data.

It was possible to calculate the occurrence of each odour type per monitoring station. For example, heavy oil odours occurred in 3.7 to 6.7% of annual odour measurements from 2002 to 2007. In 1997, it was found that heavy oils occurred in 70% of all tours, where tours included 12 monitoring stations. If you assume the worst case scenario, that heavy oil odour was observed at every station where heavy oil odour occurred on a tour, then heavy oil odours would have occurred in 70% of all odour measurements for 1997. Considering the best case scenario, where heavy oil odours only occurred at one station where heavy oil odours occurred on a tour, then heavy oil odours would have occurred in 5.9% of all odour measurements. In 1998, the best case scenario for heavy oil odours is 4.6% of all odour measurements and in 1999, it is 4.5% of all odour measurements. However, if heavy oil odours occurred at more than one station during a tour, these percentages would increase. Based on a review of the 1997 data, heavy oil odours for each month occurred at two to 10 different stations depending on the month. Therefore, the 5.9% of occurrences is highly conservative and is more likely to be approximately 12% or more (based on heavy oil occurrence at two stations per tour). Therefore, it appears as though the occurrence of heavy oil odours have decreased somewhat from pre-upgrade to post upgrade. However, it should be noted that this analysis is fairly limited due to the fact that a number of assumptions were used, and that due to a variety of factors, consistency of measurement was not assured.

In terms of other major odours, total light oil odours occurred in a best case scenario of 5.6% odour measurements in 1999. From 2002 to 2007, light oil odour occurred in 0.6% (2002) to a high of 4% (2004 and 2005). Wood odour went from a pre-upgrade high of 5.6% of measurements in 1998, to a post-upgrade high of 7.1% in 2002. Since 2002, the occurrence of wood odours decreased to 3.9% in 2006. Again, the best case scenario is highly conservative and actual occurrences were likely higher.

In terms of the degree of odour observed, an assessment can be made for post-upgrade conditions, but there was no information available for the pre-upgrade. The Forest Hills area was monitored from 2002 to 2005 at two monitoring stations. The results show that most odours were ranked as a 1, or no odour. The highest ranking in the Forest Hills area was a 4, which

occurred on two occasions (out of 636 measurements), twice in July 2004; once as a result of an effluent odour and once as the result of a septic odour.

At Champlain Heights, odours were recorded at two different stations from 2002 to 2006. Most of the odours recorded in the Champlain Height area for this period were ranked 1, or no odour. The highest ranking during this time period was 5 (out of 2088 measurements), which occurred one time in August 2004 as a result of a strong heavy oil odour and a strong sulphur odour at the Champlain Heights School monitoring station. The second highest ranking, 4, occurred 10 times during the time period at the same monitoring station. These odours were categorized as heavy oil, light ends, light oil and/or sulphur. At the other Champlain Heights monitoring station (Grandview Avenue and Champlain Drive), odours were ranked 4 on six occasions, three of these being heavy oils and three being septic odours.

At other stations, rankings of 5 occurred on only three occasions (of 13,241 measurements), and rankings of 4 occurred on 93 occasions (0.7% of all readings). It was observed that most of the high rankings (one of the 5 rankings and several 4 rankings) occurred at Vince Auto Salvage on Grandview Avenue, and at the monitoring station on Creighton Drive (several 4 rankings), and that most of these high rankings were a result of heavy oil odours.

It is AMEC's understanding that IOL has hired ODOTECH, an environmental company specializing in odour control, to complete an odour study in the vicinity of the Refinery. The results of this study, which was under review, should give a better indication of current odours in the area.

2.4 Noise Assessment

Health Canada, in the "Canadian Handbook on Health Impacts Assessment – Volume 4: Health Impacts by Industry Sector", notes noise as being "any acoustic energy capable of altering the physical or psychological well-being of individuals." Elsewhere in the Health Canada website, noise is defined as "any unwanted sound". The most common unit for measuring noise is an equivalent sound pressure measured in decibels, measured on an A-weighted scale, accounting for sensitivity of the human ear (dBA). Problems that can arise as a result of noise include diminished physical, mental or social well-being due to interference with communication, disturbance of rest, sleep or concentration, hearing damage, or stress on the body leading to stress related illness.

A review of calls to IOL and NBENV makes it apparent that noise is a concern for residents living near the refinery. Based on a review of calls from 2003 to 2006, the number of calls related to noise increased in this time frame from 9 calls in 2003 to about 36 calls in 2006. However, it should be noted that there is no information on who made the calls, therefore some of the calls may have been made by the same person, for the same issue, on the same day. This does not diminish the importance of each call; however, the same noise event may be responsible for two or more complaints. Also, there is no information on concern calls prior to 2003, therefore, because the number of calls regarding noise has increased from 2003 to 2006

does not necessarily mean that the actual noise itself has increased post-upgrade. For this determination, a review of noise monitoring data was made and is described below.

Condition 10 of the Minister's Determination, dated August 13, 1998 indicated that "*The noise levels between 9 pm and 7 am originating from construction activities shall not exceed those levels presently experienced at the nearest residential property boundary during the same hours.*" In fulfillment of this condition, pre-upgrade sound measurements were made from September 16 to 28, 1998 between 9:00 pm and 7:00 am each day. Sound was measured at 14 different stations, along the northern fenceline of the property (Fencelines 1, 2, and 3), along the eastern property boundary (Granview Avenue), at key locations adjacent to residential areas (Creighton Avenue, Champlain Drive, Bayside Drive, etc.).

The PHRA reported the 1998 noise levels from the property boundary nearest to a residential neighbourhood (Champlain Heights). Measurements from this monitoring station, "Fenceline 2", were collected between 1:00 and 3:00 am in the early morning. Since the refinery operates 24 hours a day, early morning noise measurements are considered more representative of refinery noise, as readings are unlikely to be influenced by other factors such as traffic or other industries during this time of day. The results of the 1998 measurements indicated that the average noise level at Fenceline 2 was 57 dBA. At this location, the minimum value recorded during this time was 51.8 dBA and the maximum was 64 dBA, where the next highest was 58.5 dBA. Results of other measurements indicated that along Creighton Avenue and Champlain Drive, noise levels were all 50 dBA or lower, noise levels taken next to existing refinery units on site ranged from 62.3 to 86.8 dBA, and noise levels at the site of the proposed new units (as a result of existing operations) ranged from 52 to 68 dBA (Cantox 1999).

Point sound surveys were also completed during the day at various locations along the perimeter of the refinery, prior to the upgrade on April 27, 1998 (8:00 – 10:30 am), May 13, 1998 (9:00 – 11:00 am), July 21, 1998 (9:00 am – 12:00 pm) and June 16, 1999 (10:00 am – 12:00 pm). There were between 14 and 46 points surveyed during these events. The results show that the average sound measurement ranged from 41.1 to 59.5 dBA in April '98, from 44 to 65 dBA in May '98, from 43.2 to 59.4 dBA in July '98 and from 45.5 to 75.1 dBA in July '99.

Cantox also reported noise measurements taken by NBENV from October 1998 to January 1999. Noise levels were recorded from four locations: the closest residence to the refinery at Champlain Heights, at the northeast corner of the refinery at Grandview Avenue, the first residence on Red Head Road, and at the top of Midwood Avenue (Cantox 1999). The noise levels were found to be quite variable, ranging from 38 to 89.2 dBA, where higher readings were noted to be coincident with high traffic areas (Cantox 1999).

In New Brunswick, the only noise level guideline is an industrial hygiene guideline related to exposure to workers in a plant and it is not really relevant to exposures to residents in the community surrounding the refinery. There are guidelines for noise in residential areas from other jurisdictions that can be used for comparison purposes, as follows:

- Nova Scotia Environment and Labour, guidelines for Environmental Noise Measurements (NSEL 1990): 65 dBA (daytime from 7:00 to 19:00); 60 dBA (evening from 19:00 to 23:00); 55 dBA (night from 23:00 to 7:00 and on Sundays and Holidays).
- Alberta Energy and Utilities Board (EUB) Permissible Sound Levels: The old guideline ranged from 40 to 76 dBA depending on the time of day. The newest revised guideline that went into effect in February 2007 requires a sound level of 40 dBA or less at 1.5 km from facility fenceline during night time (EUB 2007).
- The US EPA, in its NSW Industrial Noise Policy notes that in urban areas the acceptable day time noise level adjacent to residences is 60 dBA and the recommended maximum is 65 dBA. In the evening, the acceptable noise level is 50 dBA and the recommended maximum is 55 dBA. During the night time the acceptable noise level is 45 dBA and the recommended maximum is 50 dBA.
- The World Health Organization (WHO) recommendation for an outdoor noise limit is 55 dBA during the day and 45 dBA at night in residential areas. Sound levels above these guidelines are considered to be "seriously annoying" but not life threatening.

The monitoring results from the fence line nearest to a residential neighbourhood (Fenceline 2) are within the Nova Scotia noise guidelines, but are slightly above the US EPA and the WHO guidelines. These measurements were taken at the fence line of the refinery property boundary; therefore, noise measurements are expected to be less at the nearest residence due to environmental factors such as wind, trees and other physical structures that would reduce noise. The EUB guideline is not relevant in this case because it relates to a point 1.5 km from the fence line of the industrial facility, where Fenceline 2 measurements were taken at the fence line.

Condition #69 of the Certificate of Approval I-2091 (October 2000 to September 2005) indicated that the IOL must complete a Sound Level Monitoring Study. In fulfillment of the condition, a second sound monitoring program was initiated in June 2001 for the post-upgrade.

Noise measurements from 2000 to 2002 were available for review during this study. During this time, levels at most of the 14 monitoring stations were recorded. It should be noted however, that during some monitoring events, the time of day when measurements were collected was not consistent and therefore average noise levels for the time frame may be slightly higher than they would have been if all readings were made during the night time. It is anticipated that other facilities in the area such as the NB Power Generation Station, the NB Power Substation, the Irving paper mill, and the industrial park also contributed to the noise that was measured surrounding the refinery, particularly during the day time. No attempt was made to separate other noise contributions from the measurements, such as other industries, the industrial park and traffic.

In 2000, noise levels were measured from January to the end of May (a period which was pre-upgrade). Most readings were recorded in the early hours of the morning, but some were recorded during the daytime. At Fenceline 2, noise was measured to be on average 52.3 dBA, a

decrease of 9% over the 1998 average level. In 2001 measurements were made over the period of June 21 to August 20. During this time period most measurements were recorded in the morning between 12:00 am and 10:00 am, however it was noted that some were recorded during the afternoon. The results indicated an average noise level at Fenceline 2 of 56.3 dBA. Measurements from December 21, 2001 to January 15, 2002 were all recorded at late night / early morning. The average measurement for this time frame was 54.6 dBA at Fenceline 2.

No measurements were available for 2003 or 2004. However, noise monitoring has occurred on a regular basis since 2005. Currently there are daily tours, conducted in conjunction with the odour tours that include measurements of sound levels, to determine if noise from the refinery is within acceptable limits.

Results for 2005 and 2006 were reviewed as part of this study. It should be noted that all measurements from 2005 to December 2006 were recorded during the day and some during peak traffic hours. Therefore, average noise levels from 2005 – 2006 are anticipated to be higher than previous readings and not entirely representative of refinery-generated noise. According to the data, at Fenceline 2, the annual average for 2005 was 60.2 dBA, calculated from the monthly averages. In 2006, the annual average decreased to 59.0 dBA. These levels are within the day time permissible and maximum recommended values quoted by NSEL and the US EPA. The levels are slightly higher than the WHO day time guideline, however as noted above, levels at the nearest residence will be lower due to reduction from other environmental factors such as wind, trees and other structures.

Cantox predicted that noise levels were unlikely to increase as a result of the upgrade, because all new units had low noise levels built into their design. They also indicated that noise levels could potentially decline as a result of the demolition of Crude Unit #2 and the relegation to backup status of Crude Unit #1 (Cantox 1999). They noted that there was little information on the potential change to noise as a result of flares, therefore, Cantox noted that, although flaring is often a cause of anxiety and annoyance to neighbours, the frequency of flaring is small and the noise associated with flaring decreases quickly with time (Cantox 1999). Cantox also noted that there was little information on noise levels from planned startup and shutdowns but indicated that the noise is expected to be minimized by following detailed procedures for each unit in addition to using vent silencers. Finally, Cantox concluded that noise levels were not expected to increase as a result of the upgrade and that no adverse impacts related to noise were expected to occur in adjacent residential areas (Cantox 1999).

Because the 1998, 2000-2002 and 2006-2007 noise levels were all measured at differing times of the day, they can not be directly compared. In general 2005-2006 daytime data were equal to or slightly greater than the 1998 data. Measurements from 2000 to 2002, which were predominantly recorded in the night time, with some readings during the day, are more comparable to the 1998 levels. The trend in these measurements is shown in Figure 2.2, below. The results show that levels have not increased since the upgrade but may have decreased

slightly. However, further monitoring during the night time should be conducted to establish a more definitive trend.

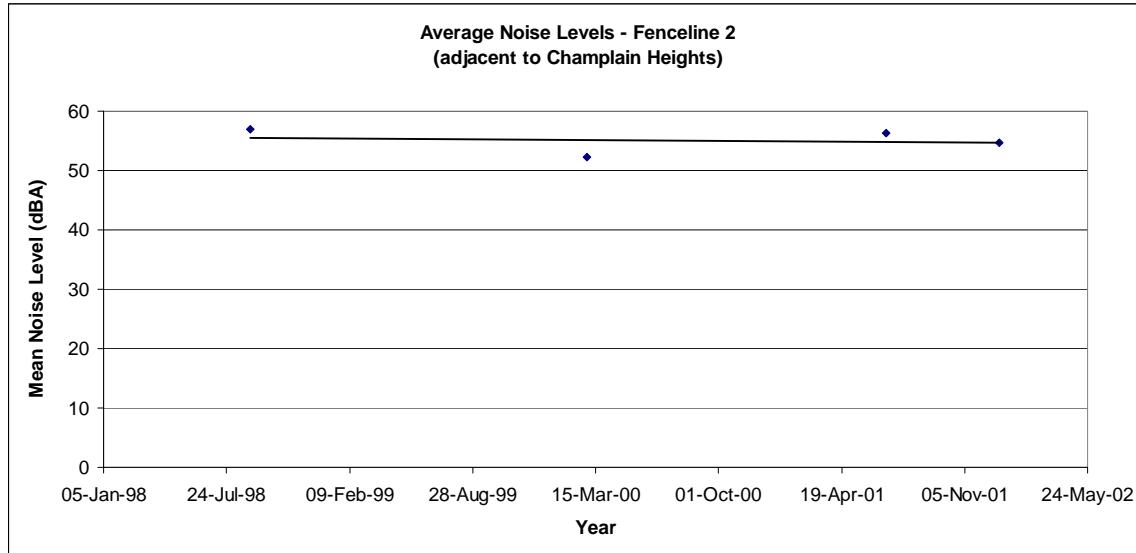

Figure 2.2 Average Noise Levels, Fenceline 2 from 1998 to 2002

It is AMEC's understanding that IOL has hired HGC Engineering, with approval from NBENV, to complete a sound survey at and in the vicinity of the Refinery. The study was reportedly completed in 2006 and since that time several silencers have been installed and several process changes were made. The results of the study were not available for review at the time of writing of this report.

3.0 COMMUNICATIONS

Three of the Validation Steps, outlined in the PHRA, centre around communication, particularly with the public as it relates to:

- training;
- new technologies;
- upsets and accidents;
- emergency response programs;
- complaint resolution mechanisms; and
- implementation of a Public Health Management Plan.

This section describes how these concerns were addressed and communicated to the public, and provides:

- an assessment of the public's level of satisfaction with the communication process; and
- whether IOL's efforts to fulfil the validation steps have been adequate.

For the purposes of the report, 'concern' is defined as: *something that interests a stakeholder because it is important or affects them, or a stated actual or perceived problem, raised by an individual or stakeholder that is either strategic or local.*

The validation steps described in the PHRA are listed below:

Communications Validation Step #1: *The IOL program for training staff and bringing the new technologies in the upgrade on line should be communicated with the public to address concerns regarding possible failures, and resulting impacts of various kinds on the community should bringing the upgrade on-line fail.*

The goal of Communications Validation Step #1 is to ensure that nearby residents are kept abreast of the new technologies that may have an impact on their community.

Communications Validation Step #2: *Due to the lack of quantitative data related to upset and accident scenarios, and the concerns raised by the public in this area, an assessment of these issues should be conducted.*

The goal of the Communications Validation Step #2 is to determine how upsets are dealt with in terms of informing the public and responding to concerns.

Communications Validation Step #3: *IOL should focus on improved communication with the public regarding their maintenance, and resulting emergency-response programs. Lack of information about the operation of the refinery promote feelings and concerns by the public related to lack of control over their lives, and fears about the operation of the refinery next to*

their neighbourhoods. These issues raise concerns of psychosocial effects on their health that then foster distrust and complaints about the operation of the refinery. The implementation of a Public Health Management Program, as discussed below, would provide a means for improved communication with the public.

The goal of the Communications Validation Step #3 is to keep the public informed about maintenance and emergency-response programs in order to curb public fears surrounding the refinery operations. This validation step also refers to a Public Health Management Program. This program was not considered to be the responsibility of IOL. In this context, the NB Department of Health has adopted a multi-targeted approach to monitoring potential emissions related effects on the health of the Saint John community and conducted health promotion efforts related to decreased smoking, better diet and exercise.

3.1 Methods

The assessment is based on records and other objective evidence arising from:

- minutes of Community Liaison Committee (CLC) meetings;
- interviews with various members of the CLC;
- interviews with IOL representatives;
- newsletters;
- notification letters;
- information on open houses; and
- other relevant documentation.

3.2 Sources of Guidance for Public Communication

The three Communications Validation Steps outline the need for improved communications with the public regarding refinery operations. There are several guidelines that exist in Canada and New Brunswick that relate to public participation at the project design or assessment level. Although a formal public participation process was not prescribed for IOL prior to the refinery upgrade, the existing guidelines are useful in undertaking the validation process.

3.2.1 The Canadian Standards Association (CSA)

The CSA publishes various guidelines related to environmental work including the CSA Standard Z764-96, "A Guide to Public Involvement". This document can be used to guide industry to incorporate public input into the design of a project. The public involvement process described in CSA Z764-96 is not considered appropriate if the project is already decided and public comments are not going to be incorporated. If the goal is only to inform stakeholders, or promote a project, a good communication program should include, but not be limited to: published reports, media releases, brochures, and open houses to let the public know about the project. Table 3.1, from CSA Z764-96, shows the different types of mechanisms for public involvement and ranks them in relation to various criteria.

Table 3.1 Mechanisms of Public Involvement

Characteristics Mechanism	Range of Issues That Can Be Accommodated	Degree of Interaction among Participants	Number of People Who Can Participate	Time Commitment to Plan and Implement	Cost of Running Mechanism	Potential for Public/Media Visibility	Expertise Required to Run Mechanism	Ability to Accommodate Different Levels of Participation

3.2.2 The Canadian Environmental Assessment Act (CEAA)

The *Canadian Environmental Assessment Act* (CEAA) relates to projects that have had or are undergoing either a screening level environmental assessment or a comprehensive study. The refinery upgrade was not subject to an environmental assessment under CEAA, however, CEAA can be used as a guide for appropriate methods of engaging the community. One of the purposes of the Act is to ensure that there are opportunities for meaningful and timely public participation throughout the environmental assessment process. CEAA specifically enables the incorporation of public comments from the public on a project, and also mandates the use of public meetings/hearings to inform and collect input from the public.

3.2.3 Provincial Environmental Impact Assessment (EIA)

In New Brunswick, the Environmental Impact Assessment (EIA) process is governed by "A Guide to Environmental Impact Assessment in New Brunswick" published by the New Brunswick Department of Environment (NBENV). Similar to CEAA, the guide establishes the requirement for public participation in the EIA process by enabling public comment on the draft report and through public meetings. The purpose of the public meeting is to give the public an opportunity to make comments, raise concerns, or ask questions about any matter contained in the EIA report. A panel of experts oversee the public meetings, receives public input, and responds to questions and concerns. The panel then prepares a report on public involvement, incorporating meeting comments and written comments submitted throughout the public comment period.

Appendix C of the New Brunswick EIA guide provides the minimum proponent sponsored public involvement standards for registered projects, some of which may be used as a comparison for IOL public communication methods employed to date. Item 1 states that the proponent shall communicate directly with elected officials, local service districts, community groups, environmental groups, other key stakeholder groups, and First Nations as appropriate, enabling them to become familiar with the proposed project, to ask questions and/or raise concerns. Suggestions for implementing these activities include organizing meetings or workshops, appearing at a stakeholder or community group's regular meeting or sending letters or information flyers. Item 2 requires that the proponent give direct written notification (letter, information flyer, etc.) about the project to potentially affected persons (residents, landowners, etc.). The written notification must include a number of items, including a brief description of the project, a description of the location, a statement that the public can ask questions or raise concerns, and the proponent contact information (name, address, phone number, etc.). Item 7 requires that the proponent must advertise and host an open house or public meeting so that the public has an opportunity to become familiar with the project and they may ask questions or raise concerns.

3.2.4 IOL Corporate Communication Plan

The IOL Corporate Communication Plan identifies a need and process for addressing public communication related to the refinery upgrade. This plan was prepared about five years ago and could not be located by IOL personnel.

3.3 Public Communication – Initial and Ongoing

The methods used by IOL to keep the public informed about the refinery upgrade are described in detail in the following subsections. Results of interviews with various CLC members and IOL representatives are included in the following sections where appropriate.

3.3.1 Community Liaison Committee

The Community Liaison Committee (CLC) was established by IOL in 2000 as the Community Awareness Liaison Committee (CALC). The committee changed its name to Community Liaison Committee in 2002.

The current mandate of the CLC is to:

“assess ways for the Irving Oil Refinery to continue to be a good neighbour and whose membership will contribute to, and benefit from, a regular information exchange. The Committee will assess community issues associated with the Saint John refinery and make recommendations to Irving Oil for consideration. The Committee will communicate with the community.”

The Terms of Reference (TOR) for the CLC was last revised on March 15, 2006. The TOR stipulates that the CLC will meet on a quarterly basis in March, June, September and December of each year and the Co-chairs have the authorization to call special meetings. The agenda and minutes will be delivered two weeks prior to the next meeting. Changes to the agenda can be made one week prior to the subsequent meeting. One IOL representative and one community member co-chair the meetings. The TOR also stipulates that membership may change to maximize the contribution from the community. The CLC, in conjunction with IOL, may appoint applicants for specified terms. The CLC will continue to deal with issues raised by non-members. The CLC will draft an annual report to submit to IOL, the Provincial government, and the City of Saint John, and the report will also be made available to the public. The TOR is provided in Appendix F.

AMEC reviewed all available minutes of CLC and CALC meetings for 2000, 2002, 2003, 2004, 2005, and 2006. There were no minutes of meetings available for 2001. According to an IOL representative, the CALC did not meet during 2001 due to a lack of staff to keep the committee and the meetings going, but then began meeting again in February of 2002.

3.3.1.1 Meeting Frequency and Participation

When the CALC was formed at the beginning of the refinery upgrade in 2000, meetings were held every one to two months. There were 8 meetings in total in 2000. When the CALC reassembled in 2002, the community members decided and IOL agreed, that future meetings should be held on a quarterly basis. The CLC continues to meet quarterly. According to interviews with current members of the group, some members indicated that they would like the meetings to be more frequent, but others indicated that sustaining interest has not always been easy.

Based on available minutes of meetings, membership appeared to be fairly good in 2000, during the refinery upgrade, with approximately 19 members, including IOL representatives and other resources such as NBENV (who were not technically members, but support to members). However, not all members attended all meetings. In 2000, there was on average 14 people who regularly attended meetings, where approximately 3 to 5 of these were support resource persons (IOL and NBENV). Through 2002, the CLC comprised approximately 9 community members.

According to interviews, some of the earlier members of the CALC had been asked to join at a public meeting (possibly for the PHRA). Through 2000, there appears to have been no new recruitment efforts for members. The available minutes for early 2002 note that there were discussions on recruiting new members. At that time, the CALC decided on criteria for accepting new members, as follows:

- unanimous decision among members;
- submission of a letter of application;
- indication of reason for interest; and
- indication of potential contribution given background and experience.

From 2003 to the end of 2005, the minutes of meetings continually noted the need to recruit new members. Action items on several minutes called for CLC members to bring forth suggestions for new members and for IOL representatives to approach local groups such as the Champlain Heights School, the New Brunswick Community College, and the St. Joachim Church to see if there was anyone interested in joining the committee. According to an IOL representative, they did not have much success in recruiting members this way. They had approached three schools and the New Brunswick Community College, with no interest. The CLC attempts to recruit one community member to represent each area around the refinery. The members reportedly had considered disbanding the CLC due to a perceived lack of interest, as attendance by community members was continually low during this time.

It was not until the winter of 2005 that there was a general announcement in the Community Connections newsletter indicating that the CLC was looking for new members. According to an IOL representative, only one person from the community responded to this ad.

In 2006, new members were added to the CLC. According to several interviewees, meetings over the past couple of years have involved about 10 attendees, including appointed resource persons and usually about 4 to 5 community members. It was indicated by an IOL representative that since the appointment of a new Community Relations Representative, the CLC seems to have a good membership base, and there have been no discussions about recruiting new members in the last year.

3.3.1.2 Meeting Format and Content

The original format of the CALC meetings in 2000, is different from the post-upgrade CLC meeting format. Generally, the CALC meeting started with the acceptance by the group of the minutes from the previous meeting. Some meetings were kicked off with a presentation from an IOL representative regarding new construction or maintenance activity. Following acceptance of the minutes, members were given time to ask questions or raise concerns (either their own or on behalf of a non-member), then IOL representatives would respond to the question or concern. If they did not know the answer to the question, they indicated that they would find the answer and report back to the person in the next meeting. Following questions and concerns, the discussion focused on any other issues brought forward by the community members. The training for new refinery technicians during the upgrade, was also presented to the committee during one of the meetings.

At the first CALC meeting, the PHRA report was presented. The CALC arranged a meeting with Cantox in March 2000 to discuss the report. However, there is no documentation of that meeting.

In 2002, when the CALC resumed meetings, the mandate, TOR, purpose of the committee, and nominations for chair, co-chair and new members were reviewed. Further meetings in 2002 began with updates on the refinery activities, followed by new business, old business and any action items.

From 2003 to the present, the committee operates as the CLC. The meeting format included the introduction of new members at the beginning of each meeting, followed by a discussion on concern calls to NBENV and the Refinery. The number and nature of concern calls was reported by an IOL representative, and the actions that were taken for each of the calls were described. The discussion on concern calls was followed by refinery news, which included discussions on any new refinery issues. The refinery news is followed generally by outstanding issues and action items. Some meetings had additional items on the agenda, but most followed this general format. Other meetings included a general discussion about the Community Connections newsletter, information on when the next issue would be distributed, the contents of the next issue and requests for input into future issues.

There were also two occasions where the regular meetings were substituted for tours of the refinery in June 2004 and September 2006.

3.3.1.3 Opportunities for Feedback

The format of the meetings allows for the members of the CLC to ask questions and raise any concerns that they might have about any the refinery's operations. The CLC members are also given opportunities to make suggestions on the content of the Community Connections newsletter and on future dealings with IOL. It was noted by one community member that they have had influence on IOL communications in the past and have succeeded in having information released to the public.

According to a representative of IOL, it has often been difficult to engage the members at the meetings and identify topics to discuss, due to a lack of feedback from community members.

3.3.1.4 Assessment of the CLC

According to interviews, most members of the CLC have indicated that they feel that their voice is being heard at the meetings and that IOL is very supportive and responsive. One of the interviewees indicated that there are usually 3 - 4 IOL representatives at each meeting, who respond to questions and if they do not have an immediate answer, report back to the CLC fairly quickly.

All interviewees generally agreed that the process is useful: meetings are well organized and run; serves the purpose of obtaining information on refinery operations; a great networking tool; and ensures IOL's accountability to the public. All CLC members interviewed indicated that they had input to each meeting's agenda.

Some interviewees indicated a desire to have some meetings at the refinery, to actually see what is going on first hand. Others indicated that they should alternate meeting locations between the different communities surrounding the refinery.

Other suggestions from CLC members about improvements that can be made included:

- Enhanced direct communications with the committee on issues so that the committee doesn't have to read about them in the paper first. They suggest that as much information as possible (unless it is confidential) should be shared with the CLC.
- More emails from IOL to the CLC between meetings to keep them informed. Several interviewees indicated that they would like to see the meetings be more frequent.
- Improved meetings records – more detail and comprehensive reporting on deliberations that occurred.
- Public access to minutes of meetings - the minutes could be posted on the IOL website.
- Invite more representatives from environmental groups to join.

The difficulties in recruiting CLC membership and limited attendance at meetings are either indicative of a lack of interest in refinery issues, general satisfaction with refinery operations or lack of awareness regarding the existence and function of the CLC. All interviewees indicate satisfaction with IOL's participation on the CLC and their rapid response to investigating and rectifying problems. However, poor awareness is possible. The CLC member names were provided in each newsletter published in 2000. But since that time newsletters have not provided CLC member names or information about the CLC and its activities.

When asked if the CLC should advertise more, one member noted that it could be a good idea but could also lead to new problems, where residents would then be calling CLC members all the time.

The TOR for the CLC identify a requirement to produce an annual report. However, this has never been completed. An annual report posted to the website would heighten community awareness of the CLC.

3.3.2 Newsletters

The community newsletter has undergone three changes since its inception in early 2000. The Community Awareness (CA) newsletter, first published in January 2000 and continued through to the end of 2000, was distributed monthly to approximately 5000 households within a 5 km radius of the refinery.

The purpose of the newsletter was to inform the public about the status of the refinery upgrade and provide information on the addition of new components. Some newsletters provided information on the number of people employed for a particular portion of the upgrade. The first newsletter, January 21, 2000, also noted that the PHRA was complete and available through the Department of Health and Community Services.

Each newsletter also included an invitation to the public to contact members of the CLC regarding questions or concerns. The phone numbers of some CLC members where listed. The November 21, 2000 newsletter included thanks from IOL for the constructive recommendation to improve communications received from the public.

From 2000 through 2001 and most of 2002, no newsletters were published. The newsletter was revived in the fall of 2002 as the Community Connections (CC) newsletter. There have been approximately three to four newsletters each for 2003 to 2006, with distribution to approximately 6000 households within a 5 km radius of the refinery. The newsletter is also available on line through the Irving Oil website.

A review of the newsletters from fall 2002 to end of 2006, reveals articles about the refinery operations, IOL in general, successful community programs that IOL is involved with (Operation Clean Up, Champlain Heights school playground), quick facts about certain IOL products, facts on air quality, and updates on studies regarding the refinery (odour study by ODOTECH, noise study by HGC Engineering). Articles on health and safety and training also appear in many of the newsletters. In some of the newsletters a professional and personal profile of a refinery employee is provided, giving the refinery a more personal appeal.

3.3.2.1 Opportunities for Feedback

The Community Connections newsletter was written and published by IOL. However, at the back of each newsletter, there is an invitation for the public to make suggestions on the newsletter, by calling a contact person at IOL or contacting a CLC member. A contact at IOL was listed with a phone number and email address, but the CLC members were not listed. Based on information observed in the minutes of CLC meetings and on interviews with CLC members, it is understood that the CLC members are also encouraged to make suggestions on content for newsletters. According to interviews from CLC members and IOL representatives, there have been no submissions of articles by residents of the community.

There was one survey published in a Community Connections (CC) newsletter (Winter 2004), asking for feedback on the publication. The results were reported at the February 2005 meeting of the CLC, but were not reported to the general public. It was noted in the CLC minutes that based on the survey, changes/improvements were made to the publication. These changes included adding more photos in the newsletter to personalize the publication and the refinery, publishing findings from the air monitoring study, and including more articles on how the refinery works. The results of the survey are presented in Section 3.3.4.1.

3.3.2.2 Assessment of the Newsletters

According to the survey posted in the CC newsletter, readers were generally satisfied with the content and frequency of the newsletter. However, it should be noted that the survey only received 15 respondents out of a distribution of 6000 households. The minimal response to the newsletter survey is a possible indication of several issues: either the residents do not read the newsletter, or they have no problems with the newsletter and/or IOL.

The interviewees generally thought that the newsletters were good and they were impressed with IOL efforts to publish them. Some interviewees indicated that the newsletter was a bit on the "fluffy" side, that it was evident that it was published by IOL because it only reported the "good stuff", and that it did not deal with more challenging issues. However, most agreed that the newsletter is a quality publication and serves the purpose of informing the public about the refinery operations.

Interviewee suggestions for improvements to the newsletter include:

- Publish a profile on CLC members and articles on what goes on in their meetings. This would give the public an indication of who the group is, what they do, and may spark interest in potential new members.
- Provide more information on violations, compliance related articles, and complaints logs.

The newsletter is distributed to 6,000 people around the refinery but reaches a wider audience through its publication online. However, the newsletter does not reference the website and therefore most people would not know that it is available online unless they happened to already be on the Irving Oil website.

There is no information on the level of satisfaction of the public regarding the previous CA newsletter.

3.3.3 Open Houses

Open houses rank high on the CSA public participation mechanisms (see Table 3.1), in terms of the degree of interaction among participants, the number of people who can participate, and on the potential for public and media visibility. It ranks medium on the range of issues that can be accommodated and the time commitment to plan and implement. There have been about 10 open houses hosted by IOL over the last six years. For example, IOL hosted its first Annual Open House in 2005, followed by a second in 2006.

The purpose of an open house is to give the public information on the refinery operations, new technologies, training, etc. It allows the public to meet with IOL staff face to face, and it allows them to ask questions in a comfortable one-on-one setting.

The open houses generally include a number of booths showing displays about a different aspect of the refinery operations. Each booth is manned by an IOL staff member knowledgeable about the particular process, who is available to respond to any questions or concerns.

Open houses are advertised in the Telegraph Journal and invitations are mailed out to neighbourhood residents.

There is limited documentation regarding open house attendance. According to a newsletter article, the 2006 open house had 25 attendees. CLC members who attended most or all of the open houses indicated that, in their opinion, the attendance was generally modest.

3.3.3.1 Assessment of Open Houses

There were no advertisements of open houses contained within the newsletters. In a few newsletters, an article was posted about an open house after the event. Most interviewees indicated that the open houses are well advertised, however, one person indicated that they could do better, perhaps public service announcements on the radio as not everyone reads the Telegraph Journal.

Most interviewees indicated that there was sufficient technical information provided at the open house, that there was sufficient technical staff on hand to answer questions and that the open houses were very informative. However, one community member noted that there should be more technical information such as National Pollutant Release Inventory (NPRI) reports, results of studies, and more official Ministry reports available at the open houses. Some CLC members indicated a preference for a town hall presentation, then a question and answer period, with the media present. One interviewee indicated that open houses should be more frequent than once per year.

3.3.4 Surveys

In 2000 a survey was published in a newsletter (see Section 3.3.2.1) relating to reader satisfaction. The results are described in more detail below.

3.3.4.1 Newsletter Survey

The survey published in the CC newsletter consisted of three separate parts. The first was a list of four items that asked to rate on a scale of 0 to 5 where 0 is least satisfied and 5 is the most satisfied. The four items were the content of the newsletter, the writing style of the newsletter, the frequency of distribution, and addressing matters that are important to the reader. The second part was a yes/no question: would the reader like to receive the newsletter more frequently. The last part is an open question asking for suggestions to make the newsletter better.

There were only 15 responses received, out of a distribution to 6000 households. The results of the survey indicated that most people (60% or more) rated the four top questions in the top two ranking spots (4 and 5). Three of the four top questions did not have any respondents rank below 3. In response to the frequency of the newsletter 7% ranked a 2 (or slightly dissatisfied). Approximately 53% of respondents said that they would not like to receive newsletters more frequently and 47% said they would like them to be more frequent.

Many of the respondents commented that they had no recommendations and that the publishers were doing a good job. Others made suggestions on the content of the newsletter which were incorporated into future publications (see Section 3.3.2.1).

3.3.4.2 Assessment of Surveys

In the seven years since the upgrade, there has only been one survey about the newsletter. More surveys during this period, with more opportunity for residents to give feedback on how IOL communicates to the public, would have given a better indication on the public perception of IOL communication efforts.

3.3.5 Concern Calls Line

Residents who encounter an odour, noise or any other issue can call the refinery (506-202-3000) at any time and log a complaint. Similarly, they can call NBENV. IOL and NBENV have maintained a record of complaint calls received from 2003 to 2006. Calls to IOL are recorded and summarized for NBENV submission on a monthly basis. From 2003 to 2006, it appears as if the number of calls has increased. For the purposes of the validation, the important issue is how IOL deals with the calls and the caller.

It was observed that in the minutes of every meeting, concern calls for the time period are summarized and discussed among the CLC members, and resolutions to the problems communicated. According to all of the persons interviewed, the way IOL deals with concern calls has been very good. If you call, someone reportedly gets back to you almost immediately. It was noted that IOL will send someone to your house or to the area in question to investigate no matter what time of day. The people that respond to phone calls are always friendly and take the calls very seriously. A few interviewees noted that the concern calls line and how residents are dealt with was IOL's strongest point: "IOL goes above and beyond the call of duty" to provide people with information. It was also observed that in some issues of the newsletter, when there had been a significant number of calls about a specific problem, IOL wrote a notice thanking residents for calling in, as it helped them to find and fix the problem.

3.3.5.1 Assessment of Concern Calls

All information indicates that IOL takes concern calls from residents very seriously and responds quickly. There was no criticism of this area of IOL communication to the public. One CLC member also noted that he didn't call the concern line, instead he called the shift supervisor directly and that they were very nice and helpful.

3.3.6 Letters to Residents

The community is made aware of any scheduled maintenance operation, or other events at the refinery that may create dust, noise, or odour in letters that are mailed out or hand delivered to households.

Letters are also distributed to residents to notify them of upcoming events (open houses), to provide them with information on new systems or units, responses to media reports, and some letters are apologies for various events that may have had an impact to the neighbourhood (excessive noise or odour). One letter included a coupon for car cleaning after a release of catalyst resulted in a number of concern calls about a white substance on some neighbourhood vehicles. Other letters included fact sheets about specific projects.

3.3.6.1 Assessment of Letters to Residents

There was not a lot of information available on the level of satisfaction of the public in relation to letters received from IOL. However, a review of the letters indicated that they were sufficient in content for their purpose – to inform the resident about an upcoming event that may affect them.

3.3.7 Public Consultation

The public participation process as required by the Public Participation Regulation of the *Clean Air Act* was undertaken by DENV and IOL was a participant. In April 2005 the refinery undertook a 120-day public consultation process for the renewal of their approval to operate under the Clean Air Act. The public has a limited amount of time to comment on the draft report submitted to NBENV for the renewal. According to the NBENV, only eight people provided comments on the report. However, according to a CLC member, who had submitted comments, they believed that community concerns were reflected in the final condition of approval as it was more stringent. NBENV keeps a record of all comments submitted during this process. These comments were not available for review at the time of this assessment.

The previous public consultation process occurred during the completion of the PHRA in 1999. At that time, IOL hosted a public meeting for the PHRA. There were reportedly only 14 attendees at the open house, as the Conservation Council of New Brunswick had reportedly told people to boycott the public meeting. Among the people who did attend the meeting, it was noted that there was a lot of negativity and not many people were interested in the report.

3.3.8 Other Communication Mechanisms

In addition to the formation and maintenance of the CLC, the publication of newsletters, the distribution of newsletters concerning shutdowns and maintenance, hosting of open houses and administration of surveys, IOL has utilized other mechanisms to keep the community informed and to enhance its image as a “good neighbour”. These additional efforts are described in this section.

IOL developed a Refinery Education Kit to teach kids at the elementary school level, about refinery operations. These kits help teachers explain to their students the types of products that

are produced at the refinery, how they are made, and why it is essential that the refinery maintain a flaring system. Six kits were given to Champlain Elementary School in January of 2004.

Since the refinery upgrade, IOL has undertaken a number of extra activities that were intended as good corporate citizenship. For instance, where there may have been excessive dust after an event, IOL has offered to clean household windows in areas that were affected. Employees also participate in an annual neighbourhood clean up project around the community. IOL has also fully or partially sponsored the construction of two neighbourhood playgrounds in Forest Hills (2003) and Champlain Heights (2005).

As was noted earlier, when any anticipated shutdowns, turnarounds, or maintenance activities might cause an impact to surrounding residents, the residents are notified by a letter, often hand delivered. According to a CLC member, larger shutdown and turnaround events are often announced in the newspaper as well, for the information of the wider community.

In relation to the odour impact study that is currently being undertaken, residents were invited to participate in an Odour Observer Panel in July 2006. The panel will help IOL in managing the odour emissions and impacts to the community and raise community awareness of ongoing efforts to minimize odours. Fourteen members of the community attended the kick off meeting on July 26, 2006. Over the year, these participants were to give daily odour observations to ODOTECH to help them with the study. Periodic information sessions were also to occur. An invitation to join the panel was posted in the article "Odour Study" in Summer, 2006 CC newsletter.

IOL and the CLC sent one of the community CLC members to a national workshop in Ottawa, on a National Framework for Petroleum Emissions Reductions, with government support for travel expenses.

Communication Validation Step #3 relates to improved communication with the public regarding emergency-response programs. IOL communicated to the CLC that they have an Emergency Response Plan in place but that they could not provide any detailed information as it would compromise security.

3.4 Conclusions

Most of interviewees had lived in the area since about the 1970's and there was a unanimous response regarding IOL communication to the public, indicating that what is being done now is far better than efforts of a decade ago. One interviewee noted that since the upgrade there have been huge improvements. It was stated that IOL seems to be doing all that they can and that there are not as many complaints as there used to be.

The only area of criticism regarding IOL communication is that there appears to be a little bit of bias in everything published or released to the community. The message is that IOL should be more comprehensive with their communications: "tell us the good and the bad".

In terms of the three Communication Validation Steps, IOL has provided sufficient and frequent information to the public on new technologies to fulfill validation step #1. However, there has been a lack of information on the IOL program in place for training staff, although several newsletters published short articles on training for new technicians.

In terms of validation step #2, IOL appears to take the concerns of the public very seriously and there is sufficient evidence to support this claim. The concerns of the public are being heard and responded to as quickly as possible and to the satisfaction of the community.

Through the newsletters and open houses the community has been provided with a variety of technical and non technical information to support validation step #3, with the exception of the information on emergency response programs, which has not been publicly communicated due to security issues. One improvement that could be made in relation to validation step #3 is to improve the visibility of the CLC to the public, either through articles in the newsletters, publication of minutes, or posting of information online.

4.0 INHALATION RISK ASSESSMENT OF VOCs

AMEC has conducted a human health risk assessment of potential inhalation risks from chronic exposure to volatile organic compounds (VOCs) in the vicinity of the IOL Refinery in Saint John, New Brunswick. This risk assessment is a supplementary task performed by AMEC in conjunction with its Validation of the PHRA for the Irving Oil Refinery Upgrade.

The current risk assessment was conducted according to the human health risk assessment framework endorsed by Health Canada (2004a), which includes the following steps:

- problem formulation;
- exposure assessment;
- toxicity assessment; and
- risk characterization.

4.1 Problem Formulation

The problem formulation step of the risk assessment identified the chemicals of potential concern (COPCs), the receptors, and the exposure pathways. The COPCs that were identified included VOCs for which recent (post-expansion) ambient monitoring data are available. The 17 VOCs for which risks were assessed included:

- Acetaldehyde,
- Acrolein,
- Benzaldehyde,
- Benzene,
- Crotonaldehyde,
- Ethylbenzene,
- Formaldehyde,
- Hexanal,
- Isovaleraldehyde,
- Methyl tertiary-butyl ether (MTBE),
- Propionaldehyde,
- m-Tolualdehyde,
- p-Tolualdehyde,
- Toluene,
- Valeraldehyde,
- m- and p-Xylenes, and
- o-Xylene.

Potential receptors were assumed to be residents in the vicinity of the Site, and inhalation was the pathway of concern via which residents would be exposed to VOCs.

4.2 Exposure Assessment

The exposure assessment step of the risk assessment determined the VOC concentrations to which a receptor would be exposed in the vicinity of the Site and characterized any receptor-specific parameters that may influence potential human health risks.

Post-expansion ambient air monitoring data exists for VOCs for two areas in the vicinity of the Site: Champlain Heights and Forest Hills. Data for these two areas are summarized in Tables 4.1 and 4.2, respectively. It is important to note that these data indicate mean VOC concentrations in air but provide no information as to the source of these VOCs.

For comparison purposes, typical exposure levels in air for selected VOCs are presented in Table 4.3. As shown, the exposure concentrations for VOCs at Champlain Heights and Forest Hills are comparable to typical exposure concentrations for other parts of Canada.

Non-carcinogenic risks were assessed assuming continuous exposure for a resident in the vicinity of the Site; therefore, no additional resident exposure parameters were required. Carcinogenic risks were assessed for a resident who is assumed to be exposed for the duration of adulthood (56 years) with lifetime cancer risks amortized over the entire life expectancy of 75 years (Health Canada, 2004a).

4.3 Toxicity Assessment

The toxicity assessment step of the risk assessment identified carcinogenic and/or non-carcinogenic dose-response values for each VOC. Dose-response values used in Cantox (1999) were reviewed to determine if they were still valid for use in the current risk assessment. Dose-response values that were used in Cantox (1999) are summarized in Table 4.4 and those that were used in the current risk assessment are summarized in Table 4.5.

Health Canada was the primary source that was investigated for VOC dose-response values. It was determined that the Health Canada dose-response values for toluene, *m*- and *p*-xylenes, *o*-xylene, and MTBE that were used in Cantox (1999) were still valid for use in the current risk assessment. Also, it was found that Health Canada developed guidance for inhalation exposure to acetaldehyde, acrolein, benzene, and formaldehyde subsequent to the completion of Cantox (1999). This guidance therefore superseded the U.S. EPA-derived dose-response values that were used by Cantox (1999).

For example, although Cantox (1999) identified both non-carcinogenic and carcinogenic dose-response values for formaldehyde, Health Canada (2006), states: "the risk of cancer associated with formaldehyde levels sufficiently low to prevent irritation and inflammatory responses appears ... to be negligible". Health Canada has therefore developed an 8-hour residential exposure limit for non-carcinogenic effects, but it has not developed a carcinogenic dose-response value for formaldehyde. In accordance with this position, the current risk assessment uses the non-carcinogenic dose-response value for formaldehyde.

Table 4.3 Typical Exposure Concentrations for Selected VOCs in Canada

VOC	Concentration ($\mu\text{g}/\text{m}^3$)	Source
Acetaldehyde	1.50	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
	1.9	Mean ambient air concentration for 2805 24-hour samples (rural, suburban and urban locations at 14 sites in six provinces surveyed between 1989 and 1997; Environment Canada and Health Canada, 2000a)
Acrolein	0.09	Mean annual concentration from 4 NAPS monitors 60418, 50104, 70119, 40203* (1998-2003) (Environment Canada, 2008)
	0.18	Mean ambient air concentration for 2816 24-hour samples (rural, suburban and urban locations at 15 sites in five provinces surveyed between 1989 and 1996; Environment Canada and Health Canada, 2000b)
Benzaldehyde	0.15	Mean annual concentration from 4 NAPS monitors 60418, 50104, 70119, 40203* (1998-2003) (Environment Canada, 2008)
Benzene	1.23	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
	4.4	Mean ambient air concentration for 586 24-hour samples (10 cities surveyed between 1988 and 1990; Environment Canada and Health and Welfare Canada, 1993)
Crotonaldehyde	0.11	Mean annual concentration from 3 NAPS monitors 50104, 70119, 40203* (1998-2003) (Environment Canada, 2008)
Ethylbenzene	0.71	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
Formaldehyde	2.19	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
	30 - 40	Typical mean concentrations in air of Canadian homes (Health Canada, 2006)
Hexanal	0.16	Mean annual concentration from 4 NAPS monitors 60418, 50104, 70119, 40203* (1998-2003) (Environment Canada, 2008)
Isovaleraldehyde	NA	

Table 4.3 Typical Exposure Concentrations for Selected VOCs in Canada

VOC	Concentration ($\mu\text{g}/\text{m}^3$)	Source
MTBE	<30	No Canadian data was available, but concentrations of MTBE in ground-level air at three refineries in the United States were <30 (Environment Canada and Health and Welfare Canada, 1992a)
Propionaldehyde	0.65	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
<i>m</i> -Tolualdehyde	0.01	Mean annual concentration from 4 NAPS monitors 60418, 50104, 70119, 40203* (1998-2003) (Environment Canada, 2008)
<i>p</i> -Tolualdehyde	0.01	Mean annual concentration from 4 NAPS monitors 60418, 50104, 70119, 40203* (1998-2003) (Environment Canada, 2008)
Toluene	4.75	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
	3.5 - 44.2	Mean ambient air concentrations in six urban areas and at two rural sites in Canada, measured between 1983 and 1989 (Environment Canada and Health and Welfare Canada, 1992b)
Valeraldehyde	NA	
<i>m</i> - and <i>p</i> -Xylenes	2.23	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
	1.8 - 18.3	Mean ambient air concentrations at 17 Canadian urban or suburban sites in nine cities during 1988 and 1989 (Environment Canada and Health Canada, 1993)
<i>o</i> -Xylene	0.71	Mean annual concentration from 5 NAPS monitors 60418, 50104, 70119, 40203*, 30501 (1998-2003) (Environment Canada, 2008)
	0.7 - 7.6	Mean ambient air concentrations at 17 Canadian urban or suburban sites in nine cities during 1988 and 1989 (Environment Canada and Health Canada, 1993)

Notes:

NAPS: National Air Pollution Surveillance

* mean concentration for NAPS monitor 40203 is not a true annual average (ranges between 2 and 9 months).

NA: typical Canadian data not available

Table 4.4 Carcinogenic and Non-Carcinogenic Dose-Response Values used in the Cantox (1999) Risk Assessment

VOC	Non-Carcinogenic Dose-Response Value ($\mu\text{g}/\text{m}^3$)	Carcinogenic Dose-Response Value ($\text{mg}/\text{m}^{3\cdot-1}$)	Source
Acetaldehyde	9		RfC (U.S. EPA, 1999)
		0.0022	URF (U.S. EPA, 1999)
Acrolein	0.02		RfC (U.S. EPA, 1999)
Benzaldehyde	304		RfC estimated from RfD of 100 $\mu\text{g}/\text{kg}\cdot\text{day}$ (U.S. EPA, 1999), multiplied by body weight of 70 kg (Health Canada, 1994) and divided by inhalation rate of 23 m^3/day (Health Canada, 1994)
Benzene		0.0078	URF (U.S. EPA, 1999)
Crotonaldehyde		0.62	URF estimated from CSF of 1.9 ($\text{mg}/\text{kg}\cdot\text{day}$) ⁻¹ (U.S. EPA, 1997), divided by body weight of 70 kg (Health Canada, 1994) and multiplied by inhalation rate of 23 m^3/day (Health Canada, 1994)
Ethylbenzene	100		RfC (U.S. EPA, 1999)
Formaldehyde	2		RfC (CalEPA, 1997)
		0.013	URF (U.S. EPA, 1999)
Hexanal	0.02		RfC for acrolein (U.S. EPA, 1999) used as surrogate
Isovaleraldehyde	0.02		RfC for acrolein (U.S. EPA, 1999) used as surrogate
MTBE	37		TC (Health Canada, 1996)
Propionaldehyde	0.02		RfC for acrolein (U.S. EPA, 1999) used as surrogate
<i>m</i> -Tolualdehyde	0.02		RfC for acrolein (U.S. EPA, 1999) used as surrogate
<i>p</i> -Tolualdehyde	0.02		RfC for acrolein (U.S. EPA, 1999) used as surrogate
Toluene	3800		TC (Health Canada, 1996)

Table 4.4 Carcinogenic and Non-Carcinogenic Dose-Response Values used in the Cantox (1999) Risk Assessment

VOC	Non-Carcinogenic Dose-Response Value ($\mu\text{g}/\text{m}^3$)	Carcinogenic Dose-Response Value ($\text{mg}/\text{m}^{3\text{-}1}$)	Source
Valeraldehyde	0.02		RfC for acrolein (U.S. EPA, 1999) used as surrogate
<i>m</i> - and <i>p</i> -Xylenes	180		TC (Health Canada, 1996)

Factor

RfC: Reference Concentration

RfD: Reference Dose

If no dose-response information could be identified in any Health Canada source, then current information was obtained from U.S. EPA, per Health Canada (2004a) recommendations. It was determined that U.S. EPA dose-response values for ethylbenzene and benzaldehyde that were used in Cantox (1999) were still valid for use in the current risk assessment. Note that Cantox (1999) estimated the inhalation dose-response value for benzaldehyde based on U.S. EPA oral dose-response information in conjunction with typical Canadian adult body weight and inhalation rate values obtained from Health Canada (1994); the current risk assessment used the same approach with the same U.S. EPA oral dose-response information, but used up-to-date typical Canadian adult body weight and inhalation rate values obtained from Health Canada (2004a). Crotonaldehyde was formerly assessed by Cantox (1999) using a U.S. EPA carcinogenic dose-response value obtained from HEAST (U.S. EPA, 1997). However, a review of HEAST indicates that the value in this guidance document was actually obtained from the U.S. EPA IRIS Program at the time. Given that U.S. EPA (2008a) currently states "a quantitative estimate of carcinogenic risk from inhalation exposure to crotonaldehyde has not been assessed under the IRIS Program", a carcinogenic dose-response value for crotonaldehyde was not used in the current risk assessment.

If no dose-response information could be identified in any Health Canada or U.S. EPA source, then the information was searched for, in order of preference, in documents published by the World Health Organization (WHO), the Netherlands National Institute of Public Health and the Environment (RIVM), and the U.S. Agency for Toxic Substances and Disease Registry (ATSDR), per Health Canada (2004a) recommendations. No dose-response information was identified in any of these sources for crotonaldehyde, *m*-tolualdehyde, *p*-tolualdehyde, propionaldehyde, valeraldehyde, isovaleraldehyde, or hexanal. Therefore, similar to Cantox (1999), surrogate dose-response values were used for each of these VOCs. However, unlike Cantox (1999), which used the same inappropriately conservative surrogate (acrolein) for each VOC that lacked a dose-response value, the current risk assessment used a much more scientifically defensible approach by choosing individual surrogates for each of the above-listed VOCs based on structural (and thus chemical and toxicological) similarities. Upon review, it was determined that: acrolein was most appropriate to use as a surrogate for crotonaldehyde (both of these aldehydes contain a carbon-carbon double bond); benzaldehyde was most appropriate to use as a surrogate for *m*-tolualdehyde and *p*-tolualdehyde (each of these aldehydes contains an aromatic ring); and acetaldehyde was most appropriate to use as a surrogate for propionaldehyde, valeraldehyde, isovaleraldehyde, and hexanal (the carbon chain in each of these aldehydes is saturated).

U.S. EPA Acute Exposure Guideline Levels (AEGLs), which are used to assess the risk resulting from once-in-a-lifetime, or rare, exposure to airborne chemicals (U.S. EPA, 2008b), provide additional evidence that the choice of surrogates in the current risk assessment is superior to the approach used by Cantox (1999). AEGLs for acrolein and crotonaldehyde are very similar (0.030 ppm and 0.19 ppm, respectively), and they are much lower than the AEGLS that exist for saturated aldehydes (AEGLs for acetaldehyde and propionaldehyde are each 45 ppm).

4.4 Risk Characterization

Risk characterization results for Champlain Heights and for Forest Hills are presented in Tables 4.6 and 4.7, respectively.

Potential non-carcinogenic risks due to chronic inhalation of a VOC were quantitatively assessed by calculating a Hazard Quotient (HQ), which is calculated as:

$$HQ = \frac{\text{Air Concentration } (\mu\text{g/m}^3) \times \text{fraction of time exposed } (1/\text{y})}{\text{Non-Carcinogenic Dose - Response Value } (\mu\text{g/m}^3)}$$

The HQs for VOCs that have dose-response values based on similar toxicological endpoints (shown in Table 4.5) were added together to calculate a total Hazard Index (HI) for each endpoint. According to Atlantic Risk-Based Corrective Action guidance (Atlantic RBCA, 2007), non-carcinogenic risks are considered acceptable if HQs and HIs do not exceed 1.0. This target risk criterion was also used by Cantox (1999). As shown in Tables 4.6 and 4.7, each of the individual HQs, and each of the endpoint-specific HIs, are much less than 1.0.

Potential carcinogenic risks due to chronic inhalation of a VOC were quantitatively assessed by calculating the Incremental Lifetime Cancer Risk, which is calculated as:

$$\begin{aligned} ILCR &= \text{Air Concentration } (\text{mg/m}^3) \times \text{fraction of time exposed } (56/75) \\ &\quad \times \text{Carcinogenic Dose - Response Value } (\text{mg/m}^3)^{-1} \end{aligned}$$

ILCRs were added together to calculate a total ILCR due to inhalation exposure to carcinogenic VOCs. According to Atlantic Risk-Based Corrective Action guidance (Atlantic RBCA, 2007), carcinogenic risks are considered acceptable if ILCRs do not exceed 1×10^{-5} . This target risk criterion was also used by Cantox (1999). As shown in Tables 4.6 and 4.7, each of the individual ILCRs, and the total ILCRs, are less than this criterion.

4.5 Conclusion

AMEC has conducted a human health risk assessment of potential inhalation risks from VOCs in the vicinity of the IOL Refinery Upgrade in Saint John, NB, to determine if the levels of VOCs in Saint John ambient air pose undue chronic risks to residents of Saint John. The risk assessment cannot determine the chronic risks from VOCs caused by the IOL Refinery Upgrade, because it used exposure data from monitors that measure VOCs emitted from all sources in the vicinity of the Site. It is therefore impossible for this risk assessment to make any distinction between risks from VOCs emitted from the IOL Refinery, and risks from VOCs emitted from other sources in the area. Given that this highly conservative scenario has determined that residents living year-round in the areas of Champlain Heights and Forest Hills in Saint John, NB would not experience unacceptable non-carcinogenic or carcinogenic risks due to chronic VOC exposure, it can confidently be concluded that chronic risks due solely to VOCs emitted from the IOL Refinery upgrade would also be acceptable.

(f) Total Incremental Lifetime Cancer Risk		4E-06

5.0 OVERALL CONCLUSIONS

Based on the information obtained and analyzed in conjunction with this study, AMEC has arrived at the following conclusions:

1. Emissions at the refinery have, for the most part, been in keeping with, or lower than the values predicted.
2. Ambient air quality, as measured at consistent site locations both pre- and post-upgrade have not shown significant changes/trends, either in average values, or in numbers of exceedences of Provincial Objectives
3. The de-novo risk assessment conducted for VOC's and an inhalation pathway confirmed that the residents living year-round in the areas of Champlain Heights and Forest Hills in Saint John, NB would not experience unacceptable non-carcinogenic or carcinogenic risks due to chronic VOC exposure from all sources in the area.
4. The risk of exposure to MTBE which was assessed as part of the 1999 Human Health Risk Assessment associated with the refinery upgrade is no longer relevant as MTBE is reportedly no longer used at the refinery.
5. Based on the findings of the de-novo risk assessment of VOCs from all sources, it can confidently be concluded that chronic risks due solely to VOCs emitted from the IOL refinery upgrade will also be acceptable.
6. The IOL communication program is adequate and supported by the overall positive responses received from individuals interviewed in conjunction with this study.

AMEC's overall conclusion is that the predictions of air quality changes which the PHRA depended upon were generally conservative in nature, and thus were suitable for use in Cantox's assessment of health risk. While the evidence with regard to odours and noise is much less detailed, there is sufficient data indicating that there is nothing to suggest health impacts from these parameters as a result of the upgrade.

6.0 CLOSING

This report was prepared for the exclusive use of the New Brunswick Department of Health, for specific application to the subject Site. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the responsibility of the third party. Should additional parties require reliance on this report, written authorization from AMEC will be required. With respect to third parties, AMEC has no liability or responsibility for losses of any kind whatsoever, including direct or consequential financial effects on transactions or property values, or requirements for follow-up actions and costs.

The report is based on data and information provided to AMEC during the Validation Study conducted by AMEC. It is based solely on the information provided which is assumed to be valid. Except as otherwise may be specified, AMEC disclaims any obligation to update this report for events taking place, or with respect to information that becomes available to AMEC after the time during which AMEC conducted the Validation Study.

In evaluating the Public Health Risk Assessment, AMEC has relied in good faith on information provided by other individuals and organizations noted in this report. AMEC has assumed that the information provided is factual and accurate. In addition, the findings in this report are based, to a large degree, upon information provided by the current owner/occupant. AMEC accepts no responsibility for any deficiency, misstatement or inaccuracy contained in this report as a result of omissions, misinterpretations or fraudulent acts of persons interviewed or contacted.

AMEC makes no other representations whatsoever, including those concerning the legal significance of its findings, or as to other legal matters touched on in this report, including, but not limited to, ownership of any property, or the application of any law to the facts set forth herein. With respect to regulatory compliance issues, regulatory statutes are subject to interpretation and change. Such interpretations and regulatory changes should be reviewed with legal counsel.

This Report is also subject to the further Standard Limitations contained in Appendix G.

Attention: Mr. Mike Cormier

Dear Mr. Cormier:

Re: Methods Report for Validation of the Public Health Risk Assessment for the Irving Oil Refinery Upgrade

Introduction

This report outlines the methodologies to be employed during the validation of the Public Health Risk Assessment (PHRA) for the Irving Oil Refinery in Saint John, New Brunswick. The methodology has been broken down into a total of 8 tasks as detailed below.

Task 1 - Project Initiation Meeting

AMEC met with the Client/Steering Committee in order to review its proposal and help ensure that all items of concern to the Client have been covered in the Workplan, and that there are no additional task items, or issues regarding particular methodologies. In particular, the discussion will help to ensure that the Approval (I-4904) requirements are addressed.

The kick off meeting was conducted on February 22, 2007 where the senior members of the study team met with the members of the steering committee and reviewed the project scope and discussed various aspects of the project. During the course of the meeting, it was first agreed that it would be worthwhile to provide a methodology, or methods scoping document for the communications evaluation aspect of the project. It was later determined that it would be beneficial to provide a document that outlined how the entire project scope would be addressed. This methods report document has been prepared to fulfill the request of the steering committee to provide additional detail on how the work will be completed to fulfill the project mandate.

Task 2 - Obtain Data from NBENV and IOL and Conduct Preliminary Review

AMEC will review the relevant files held by both the New Brunswick Department of Environment (NBENV) and the Department of Health & Wellness (DH&W) in order to extract information with respect to:

- Emissions data, including stack tests reported as well as data from continuous emission monitors (CEMS);

TE71022-Methods Report-Oct17_07_bm-md-jp.doc

- Ambient air quality data as reported by both Government and industrial networks in the vicinity of IOL;
- Ambient air quality data from specific studies in the vicinity of IOL;
- Data with respect to ambient noise studies;
- Incident reports with respect to IOL operations – While AMEC appreciates that incident reports are only available in hard copy format, at least a sampling of reports is considered necessary to evaluate response/communication;
- Public complaints with respect to air pollution, noise pollution and light pollution;
- Relevant reports from Environment and Health officials; and
- Odour Studies, if available.

Additional relevant supplemental information will also be provided by IOL to assist in the completion of the validation study.

Collection of data will be limited to that which is reasonably available as per the RFP, and does not include further data collection and assembly. Should the validation study indicate that the available data is insufficient to allow one or more validation steps, AMEC will recommend appropriate method(s) for obtaining the necessary data.

Task 3 - Review Relevant Files with IOL Staff

AMEC will review relevant files with IOL staff at the refinery in order to obtain further information, which may be available with regard to:

- Emissions data;
- Upset conditions/frequencies/characteristics;
- Modelling studies;
- Public complaint logs;
- Communications plan(s) and implementation steps;
- Available communication documents including but not limited to newsletters, minutes of Liaison committee meetings, open house documentation, letters to community members, etc.; and
- Current and expired Approvals to Operate and Approvals to Construct.

Task 4 - Review the Ambient and Emissions Data

AMEC will review the ambient data as well as the emissions and source testing data, and will confirm that the N.B. Department of the Environment is satisfied with the validity of the data. In addition, the data will be evaluated to ensure that all of the validation requirements are responded to. Should there be a discrepancy, AMEC will contact NBENV, DH&W and IOL to ascertain whether the required data is available. Should the necessary data not be available, AMEC will recommend to the Client a possible method(s) for satisfying the Validation requirements.

A number of reports and other data have been provided to AMEC for review thus far, including:

- Ambient air data from 1996 to the present at 11 different monitoring stations. The ambient air quality data includes concentrations of SO₂, NO₂, NO, NO_x, PM10, PM2.5, total reduced sulphur (TRS), and O₃ (at one station only) on a daily basis.
- An ambient air monitoring assessment completed by Conestoga-Rovers & Associates (CRA) in 2005.
- Odour data from 1997 to 2002.
- Volatile Organic Carbons (VOCs), polycyclic aromatic hydrocarbons (PAHs), polychlorinated dibenzo-p-dioxins and-furans (PCDD/F), and metals data from 1995 to 2006.
- A PM Dispersion Study completed by Stantec Consulting Ltd. (Stantec) in 1999.
- A SO₂ Dispersion Study completed by Stantec in 1999.
- Ambient noise data (1998 to 2007, no data from 2003-2004).
- The PHRA (Cantox).

Data are presented in the PHRA for several constituent groupings, such as the anthracene group, the fluorene group, the naphthalene group, and the benzo[a]pyrene group. AMEC will need to consult Appendix G of the PHRA and convert recent ambient monitoring data for individual constituent into these constituent groups before they can be compared to any values reported in the PHRA.

AMEC will compare late 1990's ambient air quality measurements with recent ambient measurements. Because current measurements reflect the effects of all sources near and far and not just the refinery expansion, these pre- and post-expansion comparisons do not directly measure the impacts of the refinery expansion. However, such comparisons will provide interesting perspective on the recent air quality in the area in the years after the refinery expansion.

AMEC will compare predicted ambient levels with recent ambient measurements. Cantox estimated ambient concentrations for selected constituents at Forest Hills, Champlain Heights, and Silver Falls for the refinery after expansion plus several other selected sources. Comparing these predictions to recent ambient concentrations of selected constituents for selected averaging times and statistical summaries to predictions can be performed for about 20 constituent/averaging time/statistic at the 3 locations, allowing for 60 comparisons to be made.

Note that risk assessment calculations were performed for VOCs, but the Cantox document does not present the predicted ambient concentrations in the report. Thus, AMEC cannot make any comparisons to predicted VOC levels.

In addition, measured stack emission levels will be compared to the estimated emissions levels assumed by CANTOX in their PHRA as well as against limitations cited in IOL's Air Quality Approval.

Task 5 - Preparation of Methods Report and Submit for Review by Steering Committee

At the request of the Steering Committee during the kick off meeting, conducted on February 22, 2007, AMEC has prepared this Methods Report and submitted it for review by the Steering

Committee on April 27, 2007. This methods report outlines the methodology for completion of Tasks 1 – 9, in order to fulfill the project mandate and incorporates comments received from the Steering Committee after review of the Draft Methods Report.

Task 6 - Review Public Concerns and Communications

Three of the Validation Steps, outlined in the Cantox Report, center around communication, particularly with the public as it relates to training, new technologies, upsets and accidents, emergency response programs, complaint resolution mechanisms and the implementation of a Public Health Management Plan. AMEC will review the IOL and NBENV files for information documenting how these concerns were addressed and communicated to the public, where 'concern' can be defined as: *something that interests a stakeholder because it is important or affects them or a stated actual or perceived problem, raised by an individual or stakeholder that is either strategic or local.* AMEC understands that ENV occurrence files do not include comments on how IOL communicated information regarding incidents to the public, however AMEC would like to review a sample of occurrence files in addition to a sample of electronic complaint files from NBENV.

In general, records and other objective evidence arising from Community Liaison Committees, Newsletters, Notification letters, Open Houses and other documented programs carried out by IOL will be assessed. The review findings will be evaluated from a communications perspective in an effort to determine if public concerns surrounding the Validation Steps are adequate. Should the necessary data not be available, AMEC will develop recommendations which outline possible methods to satisfy the Validation requirements which will be presented to the Client. The methodology for each of the relevant validations steps are detailed below.

Validation Step: "*The IOL program in place for training staff and bringing the new technologies in the upgrade on line should be communicated with the public to address concerns regarding possible failures, and resulting impacts of various kinds on the community should bringing the upgrade on-line fail.*"

The goal of the above validation step is to ensure that nearby residents are kept abreast of the new technologies that may have an impact on their community. The various tools employed by IOL with respect to the validation step included:

- Distribution of Community Awareness Newsletters during the upgrade (2000). This included 10 newsletters throughout the year, distributed to households surrounding the refinery. It details the status of upgrades and new technologies. It also gives a contact name and number so that the public can call for questions.
- Distribution of the Community Connections Newsletter from 2002 to the present. This included distributed to approximately 6000 households surrounding the refinery and contains information to keep the community informed of new upgrades, processes, enhancements, etc.
- Open Houses. There have been reportedly about 10 open houses in the last six years.
- Refinery Education Kit. IOL developed the education kit to help teachers explain to their students the types of products that are produced at the refinery, how they are made, and

why it is essential that the refinery maintain a flaring system. There were six classroom kits given to Champlain Elementary School.

Newsletters and any available documentation on the open houses, including surveys/questionnaires, will be reviewed to assess the effectiveness of these methods in keeping the public informed. The documents will be reviewed for readability and content. The review will attempt to answer a number of questions including:

- What is/was the distribution for the newsletters? What is the radius from the refinery that is associated with households "surrounding" the refinery? Is the distribution adequate?
- Are there minutes or records documenting the Open Houses? How many people attended? What is the format of the Open Houses?
- Why were there so little responses to surveys/questionnaires? What is the process for the surveys? Is this process adequate for getting responses?

Validation Step: *"Due to the lack of qualitative data related to upset the accident scenarios, and the concerns raised by the public in this area, an assessment of these issues should be conducted."*

The goal of the above validation step is to determine how upsets are dealt with in terms of informing the public and responding to concerns. There are a number of venues that have been set up to accommodate the concerns of the community. The two main methods include:

- Dedicated Phone Line - IOL has set up a telephone number in which citizens can call with questions or complaints. These calls are recorded and summarized for NBENV submission on a monthly basis. The caller is then provided with answers and other information where applicable.
- The Community Liaison Committee (CLC) was set up by IOL in 2000 and includes a number of community members. Its mandate includes assessing ways for the Irving Oil Refinery to continue to be a good neighbour and whose membership will contribute to, and benefit from, a regular information exchange, assessing community issues associated with the Saint John refinery and making recommendations to Irving Oil for consideration, and communicating with the community. The CLC meets regularly where issues and complaints are discussed and resolved where possible. There were 10 meetings in 2000, 1 in 2003, and 4 in 2004, 2005, and 2006. Announcements have been made in newsletters inviting community members to join the group and IOL has made calls to other groups to invite representatives to join. Committee contact names and numbers are published in the Community Connections newsletter for the community to use.
- Newsletters - Answer to questions or concerns are often discussed in articles in the newsletters which are distributed to the community.
- Open Houses - There have also been open houses in which public concerns have been discussed.

A review of the complaints log will be made, a review of the CLC meeting minutes. Interviews, in the form of a focus group, rather than on an individual basis, with CLC members, former members, and possibly people who have been invited to be members but who have turned the offer down will be completed. Interviews will also be completed with residents who have called the complaints line, in the form of a focus group (approximately 10 people). The review and interviews will be assessed in an attempt to answer a number of questions including the following questions:

- CLC - What methods are being used to recruit members? Are the methods adequate? How has attendance at the meetings been through the years? Are meeting times convenient? Are members happy/unhappy with meetings, is action being taken, etc.?
- Phone Line - How effective is call response satisfaction? If no answer, how quickly does an IOL representative get back to the caller after they have left a message? Are callers happy with the responses they have received from IOL. Did the problem get solved?

Validation Step: "*IOL should focus on improved communication with the public regarding their maintenance, and resulting emergency-response programs. Lack of information about the operation of the refinery promote feelings and concerns by the public related to lack of control over their lives, and fears about the operation of the refinery next to their neighbourhoods. These issues raise concerns of psychosocial effects on their health that then foster distrust and complaints about the operation of the refinery. The implementation of a Public Health Management Program, as discussed below, would provide a means for improved communication with the public.*"

The goal of the above validation step is the keep the public informed about maintenance and emergency-response programs in order to curb public fears surrounding the refinery operations. There are a number of methods used by IOL to keep the public informed, including:

- Letters and newsletters - The community is made aware of any scheduled maintenance operation, or other events at the refinery that may create dust, noise, or odour in letters that are mailed out the households. The newsletters also provide information on processes, upgrades, etc.
- Open Houses - source of information on maintenance and emergency response.

To assess the effectiveness of these methods, a review of letters and newsletters for content and readability will be completed as well as a review of any open house material for content and readability where applicable. The review and assessment will attempt to answer a number of questions including the following:

- What is the distribution of the neighbour letters? Is it dependent on the content of the letter? Is the distribution adequate to cover the necessary area?
- Why has the attendance at open houses been low? How are open houses advertised? Does the community not care anymore? Is the content and information at the open houses effective for keeping the public aware of maintenance and emergency response programs?

The above noted validation step refers to a Public Health Management Program that should be implemented. It is our understanding that a Saint John specific Public Health Management Program was not implemented.

Extra Communication Activities

In addition to the communication efforts that have been described above, IOL, of its own accord, has undertaken a number of extra activities that were intended as good corporate citizenship. For instance, where there may have been excessive dust after an event, IOL has offered to clean household windows in areas that were affected. Employees have also participated in a neighbourhood clean up project around the community. IOL also releases several media articles regarding the refinery and Irving in general.

Any additional communication information will be reviewed to see if any may be relevant to the validation steps described above.

Task 7 - Evaluation of the Overall Findings and Presentation of Preliminary Findings

Once Workplan Tasks 1 through 6 has been completed, the Project Team will conduct an evaluation of the overall findings of the Validation Assessment and identify areas where any information gaps may be present. A brief overview of the findings will be prepared and a meeting convened with the Steering Committee. This meeting will afford an opportunity to openly discuss the progress of the Project, findings to-date and present and discuss any preliminary recommendations to address information gaps which may have been identified during the Assessment. During the meeting, preliminary options surrounding the most appropriate method(s) to disseminate the Study findings to the public and any interest groups will be discussed.

Task 8 - Gather Additional Data to Address Gaps

Based on the outcome of the presentation outlined in Task 7, there may be a requirement to gather additional data to address gaps that were identified during the assessment process. This may require further meetings with government or IOL representatives to obtain the information necessary to assess data gaps. If it is determined that the required information is not available or does not exist, a meeting with the Steering Committee will be convened to determine an appropriate course of action. Finally, a *de novo* risk assessment will be performed for VOCs. This risk assessment will evaluate chronic risks posed by the inhalation of VOCs for which post-expansion ambient data are available.

Task 9 -Preparation of Draft and Final Reports

Once the final assessment of the available information and any new data collected to address any potential gaps has been completed, a concise draft report detailing the Validation Study findings will be produced for review and comment by the various members of the steering Committee. During the development of the draft report, the Project Team will take into consideration the communication options discussed with the Steering Committee and the report will attempt to conform to the agreed format in an effort to effectively communicate the study findings to the various stakeholder groups. Following an agreed to review period, any

comments will be discussed and the final report will be produced. The required number of copies of the final report will be provided in both French and English and made available to the steering committee for final distribution in keeping with the Terms of Reference. While Project Team members will be available to assist with any public consultation and communication needs, all control of the communication of the report findings will remain with the Client. The Project Team will treat all information obtained, reviewed or developed for the completion of the Study as Client confidential.

I hope this information meets your current needs. Feel free to contact the undersigned with any questions or concerns.

Regards,

John Pugh, P.Eng

Ministre de l'Environnement

DOCUMENT "A"

MINISTER'S DETERMINATION
File Number: 4561-3-620
CONDITIONS OF APPROVAL

1. In accordance with section 6(6) of the Regulation, it has been determined that the undertaking may proceed following approval under all other applicable acts and regulations.
2. Irving Oil Limited shall establish a Community Environmental Liaison Committee for the construction and operation of the facility. Membership, terms of reference and mandate of the committee shall be determined in consultation with the Department of the Environment. The committee shall be established by November 30, 1998.
3. The proponent must submit a plan, for approval, to the Director, Assessment and Approvals Branch, by December 31, 2001 for the cessation of the release of effluent to Little River.
4. The proponent must install a Continuous Emission Monitoring (CEM) system consistent with the Environment Canada publication (EPS 1/PG/7) "Protocols and Performance Specification of Continuous Monitoring of Gaseous Emissions from Thermal Power Generations" Environmental Protection Series, September 1993, to monitor the emissions of sulphur dioxide (SO_2) and nitrogen oxides (NO_x) from all new stacks, except the wet scrubber. This system must be fully operational upon initial startup of the upgrade, and certified one-year thereafter.
5. The proponent must conduct a feasibility study for the installation of a Continuous Emission Monitoring (CEM) system on the wet scrubber unit. The study must be completed and a report submitted to the Director of the Assessment and Approvals Branch, Department of the Environment no later than 6 months from the date of this approval.
6. The proponent must participate in a public health risk assessment in relation to the refinery operation undertaken by the Department of Health and Community Services and be completed by September 30, 1999. The cost of the study will be funded by the Department of Health and Community Services and fully recovered from the proponent.
7. Once the selected scrubber technology has been established, the proponent must provide design efficiency records, identify scrubbing agents and their waste disposal requirements to the Department of the Environment prior to obtaining the Certificate of Approval to Construct the unit.
8. The proponent must install and operate two (2) high volume samplers for monitoring of particulate matter from emitting facility stacks. The location of the monitors must be approved by the Director of the Assessment and Approvals Branch of the Department of the Environment prior to installation.
9. The proponent is presently undertaking an air quality-modeling program for SO_2 and particulate matter. All results from the study must be submitted to the Director of Assessment and Approvals Branch, Department of the Environment upon completion. The air quality-modeling program will be used to determine the potential need for additional monitoring stations in the Saint John area.

10. The noise levels between the hours of 9 p.m. and 7 a.m. originating from the construction activities shall not exceed those levels presently experienced at the nearest residential property boundary during the same hours.
11. The proponent must re-examine the number, the location and the air quality parameters monitored by the present monitoring stations and determine their effectiveness. A report must be submitted to the Director of Assessment and Approvals Branch, Department of the Environment six (6) months following start up of the new equipment.

March 14, 2000
File 4561-3-620

Mr. Robert Chalmers
General Manager
IRVING OIL LIMITED
Refining Division
P.O. Box 1260
Saint John, NB.
E2L 4H6

Dear Mr. Chalmers:

RE: EIA Determination 4561-3-620 - The Irving Oil Refinery Upgrade Project – IRVING OIL LIMITED

This letter is to advise you that condition #8 of the Environmental Impact Assessment Determination 4561-3-620 has been amended. The amended condition reads as follows:

Condition #8 – The proponent must install and operate one (1) particulate matter ambient monitor capable of continuous recording of hourly average concentrations of PM2.5 with the option of recording 30-minute averages. The location of the monitor must be approved by the Director of the Assessment and Approvals Branch and be within the area of predicted maximum impact which is in Champlain Heights. The technology selected shall be capable of collecting samples on filter media for analysis of metals should this be required in the future. NBDOE should have electronic access to the data generated in near-real time (hourly updates).

This condition does not preclude the possibility that additional monitors may be required in the future. If you require any additional information please contact Louise Steward at (506) 444-5382.

Sincerely,

Kim Jardine
Minister

Station # 010102 354 Water Street, St. John's, NL Sampling Height=1 metre

Appendix F
Terms of Reference for the
Community Liaison Committee

**Irving Oil Refinery
Community Liaison Committee**

Terms of Reference

- ◆ Meet on a quarterly basis and as required:
 - ◆ 2nd Wednesday of March, June, September and December
 - ◆ Co-chair to call special meetings;
- ◆ Agenda and minutes will be delivered two weeks prior;
- ◆ Changes to the agenda will be made one week prior;
- ◆ Irving Oil and citizens' representative will co-chair;
- ◆ The New Brunswick Department of Environment will attend as a resource;
- ◆ Irving Oil Representative(s) will attend as (a) resource(s);
- ◆ Continue to develop understanding of refining and associated environmental aspects;
- ◆ Exchange information to foster better understanding throughout our neighbourhood;
- ◆ Maintain effective communication while respecting the confidential nature of a highly competitive petroleum refining industry;
- ◆ Membership may change to maximize contribution from community. Prospective members must apply in writing to the Committee for consideration. The Committee, in conjunction with Irving Oil Limited, may appoint applicants for specified terms;
- ◆ Continue to deal with issues raised by non-members; and
- ◆ Draft annual report and submit to Irving Oil, Province, and City of Saint John and make available to the public.

**All changes to the terms of Reference were voted on and passed unanimously by the committee.*

**Irving Oil Refinery
Community Liaison Committee**

Mandate

The Community Liaison Committee will assess ways for the Irving Oil Refinery to continue to be a good neighbour and whose membership will contribute to, and benefit from, a regular information exchange.

The Committee will assess community issues associated with the Saint John refinery and make recommendations to Irving Oil for consideration. The Committee will communicate with the community.

**All changes to the Mandate were voted on and passed unanimously by the committee.*

Appendix G

Limitations

LIMITATIONS

1. The work performed in this report was carried out in accordance with the Standard Terms and Conditions made part of our contract. The conclusions presented herein are based solely upon the scope of services and time and budgetary limitations described in our contract.
2. The report has been prepared in accordance with generally accepted environmental study and/or engineering practices. No other warranties, either expressed or implied, are made as to the professional services provided under the terms of our contract and included in this report.
3. The services performed and outlined in this report were based, in part, upon information supplied by others.
4. The objective of this report was to validate the Public Health Risk Assessment, given the context of our contract, with respect to existing environmental regulations within the applicable jurisdiction. Compliance of past or current owners with applicable local, provincial and federal government laws and regulations was not included in our contract for services.
5. The site history research performed herein relies on information supplied by others, such as local, provincial and federal agencies as well as plant personnel. No attempt has been made to independently verify the accuracy of such information, unless specifically noted in our report.
6. Our observations relating to known contaminant materials in the environment at the site are described in this report. It should be noted that other compounds or material may be present in the site environment.
7. The conclusions of this report are based in part, on the information provided by others. The possibility remains that unexpected environmental conditions may be encountered at the site in locations not specifically investigated. Should such an event occur, AMEC Earth & Environmental must be notified in order that we may determine if modifications to our conclusions are necessary.
8. The utilization of AMEC Earth & Environmental services during the implementation of any remedial measures will allow AMEC Earth & Environmental to observe compliance with the conclusions and recommendations contained herein. It will also provide for changes as necessary to suit field conditions as they are encountered.
9. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it are the responsibility of such third parties. AMEC Earth & Environmental accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions taken based on this report.
