2015 New Brunswick Forest Inventory Report

Province of New Brunswick
PO 6000, Fredericton NB E3B 5H1

www.gnb.ca | 10497 | 2016.07 | ISBN 978-1-4605-0887-9

Introduction

In 2003, the Renewable Resources and Land Use Inventory Branch (RRLUIB) of the Department of Energy and Resource Development (DERD) initiated the second 10-year continuous forest inventory cycle. This was the Province of New Brunswick's "third generation" Geographic Information System (GIS) forest resource database. The RRLUIB annually acquired new 1:12 500 true colour vertical aerial photographs and ortho-photographs covering about one-tenth of the area of the province on a 10-year cycle. The new imagery was photo-interpreted to describe non-forested land, wetland, water and forested land.

Inventory Cycle Map

Past New Brunswick forest inventories (1958, 1968, 1979, and 1986) were one-time inventories that required resources for a period of three to five years to build, followed by five or more years of inactivity. In 1993, a continuous forest inventory cycle was adopted where one-tenth of the province's area was inventoried annually to stabilize the budget, availability of forest field crews, aerial photograph acquisition and photo interpretation services. No formal forest inventory report was compiled for the 1993-2002 cycle. This report covers the period from 2001 to 2010. The intent is to publish follow-up reports annually on a rolling 10-year basis. To catch up to the formal inventory cycle, the next edition will cover the period 2003 to 2012.

Components of the Forest Inventory

The process for the 2003-2012 Provincial Forest Inventory included four major activities:

1. The acquisition of aerial photography;
2. The interpretation of the aerial photography;
3. Ground sampling to verify interpretation and to collect tree measurement data to develop volumes and other stand level attributes; and
4. Forestry activity updates.

Aerial Photography

To identify the attributes that influence development of the various stand types within New Brunswick, it is necessary to acquire and then interpret aerial photographs. The standard scale of 1:12 500 has been found in the past to be an optimum scale to identify:

- Species composition (softwood and hardwood species and species groups);
- Development stage (relative stage of maturity);
- Crown closure (a measure of the amount of ground covered by the stand canopy); and

- Specific site indicators such as: poor site, partial cuts and silviculture treatments.

About 35 000 true-colour aerial photographs were acquired, scanned and printed to cover all of New Brunswick except for a 720 000 ha block of large industrial freehold in the northwest part of the province. In addition to the aerial photographs, digital ortho-photographs were built using the aerial images from 2004 to 2012.

Photo Interpretation

There was one photo interpretation contractor that interpreted the entire province except for the 720 000 ha block of large industrial freehold in the northwest. Photo interpretation was done the year after the aerial photography was acquired for each of the blocks, as illustrated in the Inventory Cycle Map on page 1. Each photograph area would be subdivided into 38 to 41 areas and individual interpreters would work on each of these.

Each block was interpreted using the following procedures:

- The 1:12 500 true-colour aerial photographs were interpreted with stereoscopes using the New Brunswick Integrated Land Classification System (available at RRLUIB, DERD). This interpretation was verified through ground sampling by the interpreter and DERD staff;
- Photo-interpreted stand information was transferred directly to a GIS database where tabular and spatial data were collected for each polygon;
- DERD supplied digital updates on harvesting and silviculture as well as historical photo-interpretation data to assist in the photo-interpretation process;
- All stand line boundaries and linear features were edge matched between contiguous ortho-photograph maps to ensure that boundaries and classifications were continuous and compatible across the photo-interpreted area.

Ground Sampling

The third phase of the forest inventory process is the ground sampling to verify the photo interpretation and to provide volume information. In New Brunswick this phase is called the Forest Development Survey (FDS). Upon the completion of the 1993-2002 cycle, a review by DERD and Crown timber licensees was conducted of the FDS program through the New Brunswick Growth and Yield Unit (NBGYU). The recommendations that came out of that review included:

- A standard plot design to be used in all forest stand types at various stages of development;
- A digital data collection system imbedding validation rules at the collection stage;
- A digital and efficient flow of stands and sample points between Crown timber and DERD;
- An unbiased and random selection of stands/points to sample;
- An unbiased sample/height tree selection process at the sample point; and
- An unbiased/systematic location of sampling points within forest stand polygons (sample points within stand polygons were determined from a fixed provincial sampling grid).

A detailed description of the FDS may be found in the document *New Brunswick's Forest Development Survey (FDS) Data Collection Manual (2003-2012 Forest Inventory Cycle)* [Available at RRLUIB, DERD].

In addition to the FDS data collected in the 2003-2012 period, FDS data collected in the 1993-2002 period were also used to determine volume and other attributes. As of January 2014 more than 75 000 FDS points were used to verify the interpretation and assign volume and other derived attributes to all forest stands.

Forestry Activity Updates

Forestry activities are reported annually for provincial Crown land. Harvest updates are submitted digitally by licensees by September 30 each year for the previous operating year. Silviculture updates are submitted throughout the operating year to DERD's Esilv process, but are extracted from the Esilv database at the end of the operating year. These updates are maintained in datasets separate from the forest layer but are cut into the forest layer to produce up-to-date forest inventory information.

Notes

The inventory is intended for use in planning and policy making by public and private agencies, but it must be supplemented for use in forest management operations as the estimates given are only valid for relatively large areas.

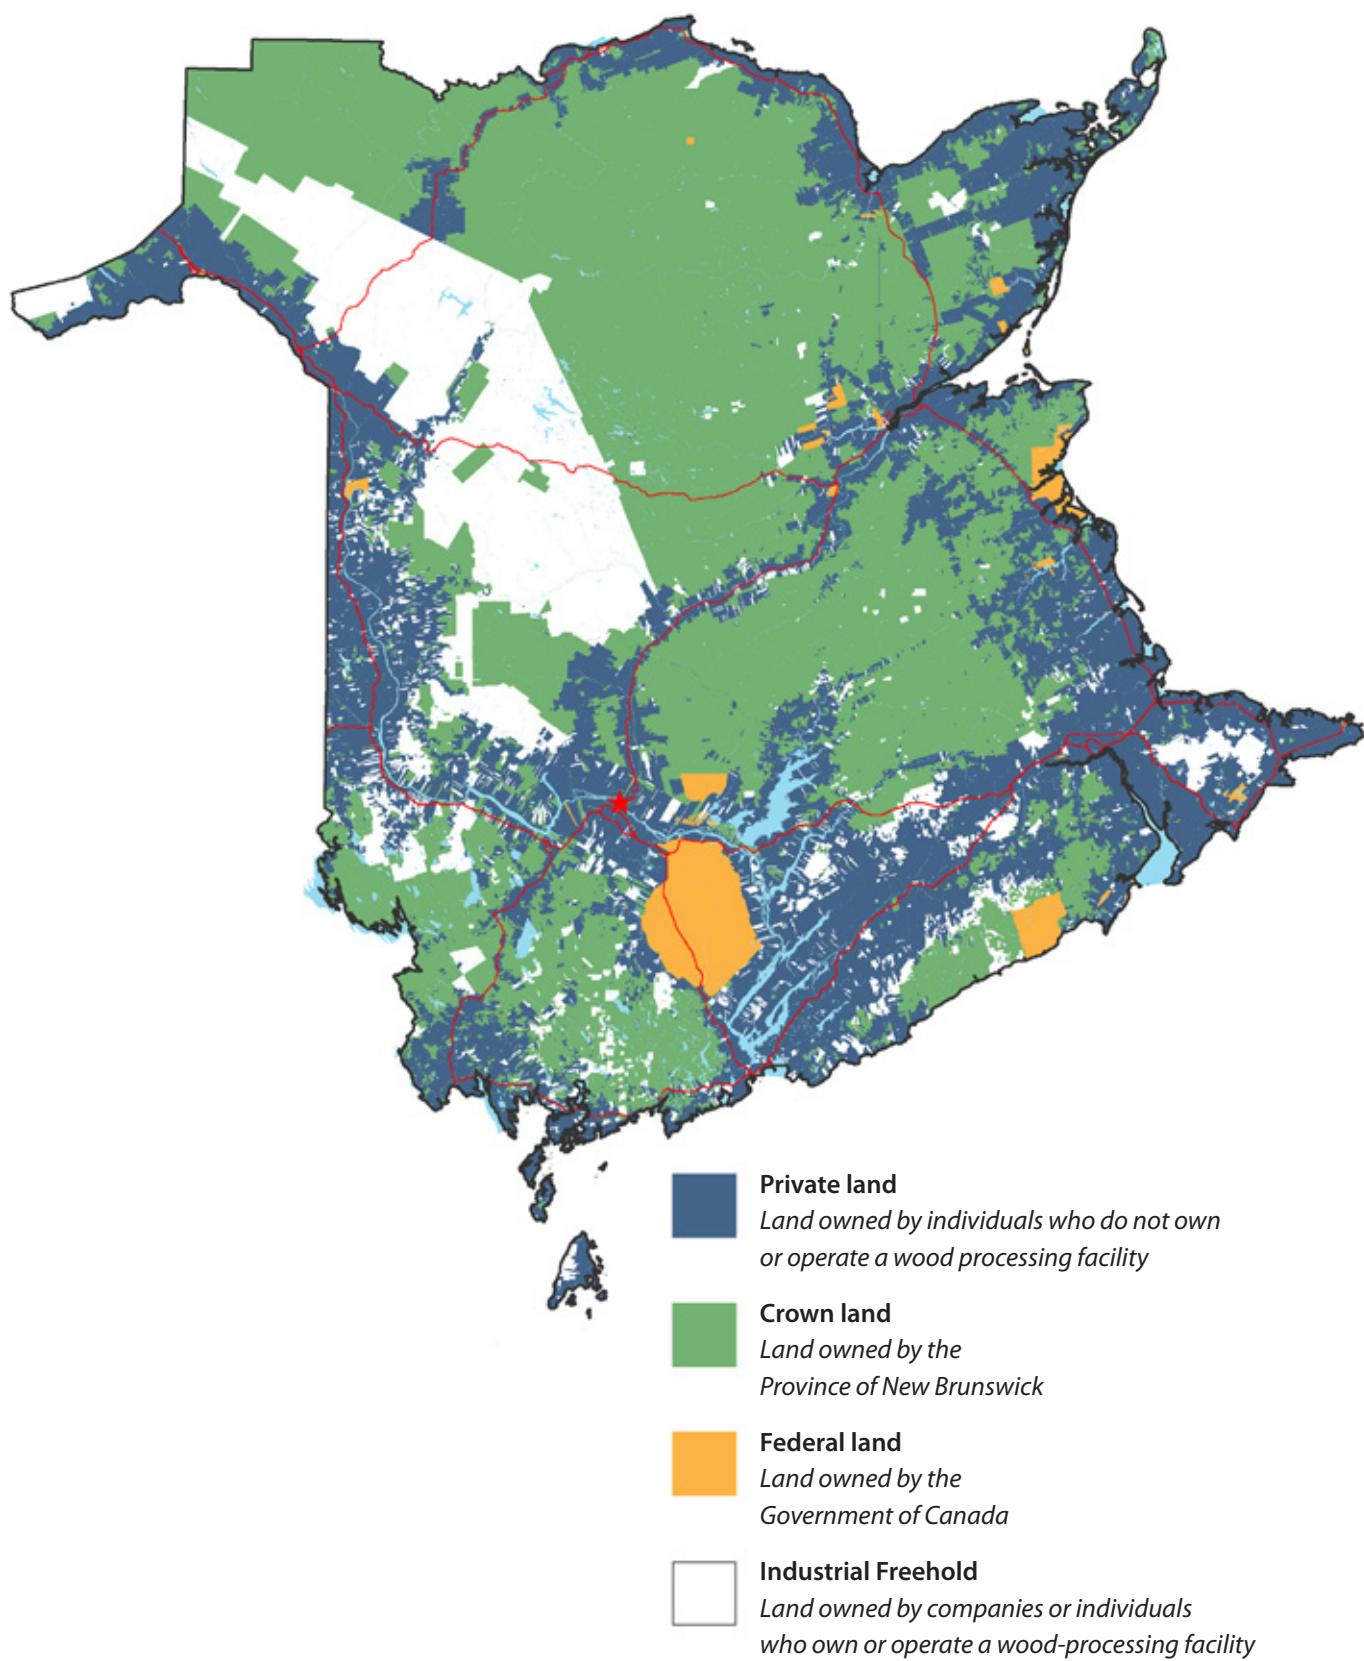

Area: The area of Crown land used in this report is reasonably up to date. However, land transactions between industrial freehold and private woodlots are happening on an ongoing basis and were up to date at the time of this report. In past reports, area summaries included inland water. Water is not included in area summaries contained in this report.

Volume: A large area of industrial freehold in the north is not described in this report as no forest inventory data was available at the time of this report. All volumes in this document are reported as net merchantable volume and will be labelled as such, except, when space is not available the abbreviation NMV will be used.

Other Crown forest land: There are 65 000 hectares of Crown forest land that are not part of a crown timber licence. This land is classified as follows:

- 40% parks and wildlife/plant protection;
- 30% Crown Leases for such things as camp lots and maple sugar operations;
- 25% forest lands managed by other Government of New Brunswick departments; and
- 5% unassigned crown forest land associated with Department of Energy and Resource Development offices and Crown access corridors.

Table PW-1	Area (ha) by land classification and marketing board on private woodlots.....	134
Table PW-2.1	Productive forest land (ha) by development stage and marketing board on private woodlots.....	134
Table PW-2.2	Distribution of productive forest land (%) by development stage and marketing board on private woodlots	134
Table PW-3.1	Area (ha) by cover type, development stage and marketing board on private woodlots.....	135
Table PW-3.2	Area distribution (%) by cover type, development stage and marketing board on private woodlots	135
Table PW-4	Area (ha) by cover type, forest unit and development stage on private woodlots	137
Table PW-5.1	Net merchantable volume (m^3) by cover type, forest unit and development stage on private woodlots.....	138
Table PW-5.2	Net merchantable volume (m^3) by cover type, species class and development stage on private woodlots	141
Table PW-6	Net merchantable volume (m^3/ha) by cover type, forest unit and development stage on private woodlots	141
Table PW-7.1	Net merchantable volume (m^3) by species and development stage on private woodlots	143
Table PW-7.2	Net merchantable volume (m^3) by marketing board, species class and development stage on private woodlots.....	144

List of Figures

Figure PW-1	Area distribution (%) by marketing board	134
Figure PW-2.1	Area distribution (%) by land classification	136
Figure PW-2.2	Area distribution (%) by development stage	136
Figure PW-2.3	Area distribution (%) by cover type	137
Figure PW-3	Area (ha x 1000) by cover type and development stage.....	138
Figure PW-4.1	Net merchantable volume ($m^3 \times 1,000,000$) by species class and development stage.....	145
Figure PW-4.2	Net merchantable volume (m^3/ha) by species class and development stage.....	145
Figure PW-4.3	Total area (ha x 1000) by development stage	145

A1. Forest Unit Name Algorithm (FUNA)

A2. New Brunswick's Integrated Land Classification System (Summary)

New Brunswick's Integrated Land Classification System delineates provincial lands and water into the following categories:

- I. Non-forested land
- II. Wetland
- III. Water
- IV. Productive forest land

I. Non-forested land classification (NFLC)

Non-forested Land is described as land that is not primarily intended for growing or supporting a forest. Although some of these areas are treed, their primary land use involves non-forested management objectives.

II. Wetland classification

Wetlands are lands transitional between terrestrial and aquatic systems where the water table is at or near the surface and the land is covered by shallow water at some time during the growing season. Wetlands are characterized by poorly drained soils, and have predominantly hydrophytic or water tolerant vegetation. New Brunswick's wetlands are grouped into two main categories: **freshwater/inland** and **coastal**. Please refer to table A2.2 (*page 233*) to see what attributes are available for each wetland or coastal feature class. The minimum polygon size (unless there are special cases) for delineation of wetlands is **1 hectare**.

The designation between freshwater wetlands or coastal wetlands (features) depends on their location on the landbase. The inland or coastal assignment will be based on the polygon's location relative to the "Ordinary High Water Mark or Landward Limit of a Coastal Feature" line. This line designation will be available as GIS layer to the photo-interpreters.

There are limitations to this line cover. On the major tributaries (i.e., Restigouche River), the delineation of coastal versus freshwater areas is not representative of the actual extent of coastal waters. These areas should be interpreted using common sense boundaries as is done with the assignment of ocean and river attributes.

III. Water classification

All water polygons greater than one hectare in area will be interpreted using the following classification:

- **Aquaculture (AQ)** – Saltwater or freshwater areas used for commercial fish farming.

- **Lake (LK)** – A natural or artificial static body of freshwater which has a depth of more than two meters in some portion of its area and is greater than five hectares in area.
- **Ocean (ON)** – A large body of salt water that is located at, along or near the province's coastline.
- **Pond (PN)** – A static body of freshwater often but not always artificially formed and is usually less than five hectares in area. They can be shallow or greater than two meters in depth with little or no emergent vegetation visible.
- **River/stream (RV)** – A watercourse formed when water flows between continuous, definable banks. Gravel bars are part of these watercourses while islands and river flats within the watercourse that have definable banks are not. A watercourse must have a width greater than twenty meters before it can be considered a river polygon.
- **Salt lake (SL)** – A static body of un-vegetated brackish water usually located on the inland side of coastal sand dunes.
- **Tidal influence (RT)** – That portion of a River/Stream that is affected by tidal influence.
- **River bed (RB)** – That portion of a watercourse that has its bed exposed at some point (photo capture) due to low water flow. (2011)

IV. Productive forest land

Productive forest land is defined as forest land that is producing or is capable of producing a merchantable stand of trees within a reasonable length of time. The Forest Development Classification System will classify productive forest land by three main categories:

- **FST 1 (Forest stand type 1)**
Productive forestland with no or minimal (occupying < 30% of the stand area) unmerchantable stand component.
- **FST 2 (Forest stand type 2)**
Productive forest land with both merchantable and unmerchantable stand components.
- **FST 3 (Forest stand type 3)**
Productive forest land with no or minimal (<35m³/ha) merchantable stand component.

A2.1 Non-forested land classification coding system

Level 1: Primary Land Use

Stand Improvement Treatment Year						4 digits				

A2.6 List of species

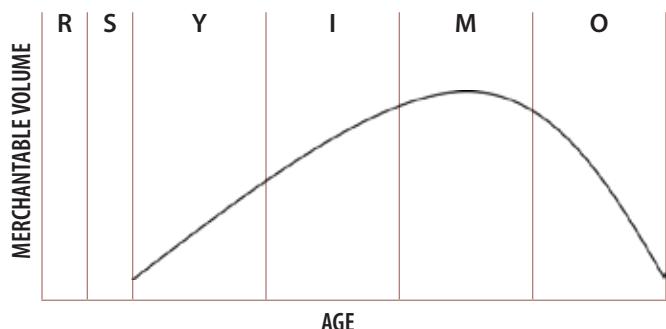

SP	When bS, rS, or wS occur in the same stand, but individually do not make up 10% of the stand volume, they are grouped and identified as SP to a maximum of 20% of the stand volume.
rS	red spruce
bS	black spruce
wS	white spruce
SF	When spruce and balsam fir occur in the same stand, but individually do not make up 10% of the stand volume and spruce is the dominant species, they are grouped and identified as SF to a maximum of 20% of the stand volume.
bF	balsam fir
FS	When balsam fir and spruce occur in the same stand, but individually do not make up 10% of the stand volume and balsam fir is the dominant species, they are grouped and identified as FS to a maximum of 20% of the stand volume.
DF	merchantable dead fir
DS	merchantable dead spruce
jP	jack pine
rP	red pine
wP	white pine
PI	When pine species occur, but individually do not make up 10% of the stand, they are grouped and identified with PI to a maximum of 20%.
tL	larch
eC	cedar
eH	hemlock
OS	When tL, eC, and eH occur, but individually do not make up 10% of the stand, they are grouped and identified with OS to a maximum of 20%.
SW	When any one or grouped softwood species (PI, OS) occur, but individually do not make up 10% of the stand (or 10% for FS and SF), they are grouped and identified with SW to a maximum of 20%.
rM	red maple
sM	sugar maple
yB	yellow birch
Be	beech
OH	other hardwood (oak, ash, elm, basswood, ironwood, silver maple) – When thinning records are available, ash (AS) can be retained as a valid interpreted species (2010-2012).
TH	When rM, sM, yB, Be and OH occur but individually do not make up 10% of the stand, they are grouped and identified with TH to a maximum of 20%.
PO	poplar (trembling aspen, large tooth aspen, balsam poplar) – When thinning records are available, individual PO species (tA, IA, bP) can be retained as valid interpreted species (2010-2012).
BI	white birch, grey birch – When thinning records are available, individual BI species (wB, gB) can be retained as valid interpreted species (2010-2012).
IH	When PO, BI and all other hardwood species (other than NC and those listed under TH) occur, but individually do not make up 10% of the stand, they are grouped and identified with HW to a maximum of 20%.
HW	When any one or grouped hardwood species (rM, sM, yB, Be, OH, PO, BI, IH, TH) occur, but individually do not make up 10% of the stand, they are grouped and identified with HW to a maximum of 20%.
NC	non-commercial hardwood tree species (pin cherry, choke cherry, alders, willows, mountain maple, striped maple, mountain ash, apple)
AI	alders
•	When other tree species not listed above appear in existing Silviculture records, they are to be retained in the interpreted species list.

A2.7 Development stage

The development stage is a classification which represents the age and condition of a species, group of species or forest stands. The development stages used for this classification are listed as follows:

- R** Regenerating
- S** Sapling
- Y** Young
- I** Immature
- M** Mature
- O** Overmature

A graph defining the development stages with respect to volume and age

The following gives some further information about each stage:

Species ages used to determine the development stage of a species, group of species or forest stand

Species	Stand Age					
	R	S	Y	I	M	O
Balsam Fir	0 – 12	10 – 25	20 – 35	30 – 50	45 – 70	65 +
Red Spruce	0 – 12	10 – 30	25 – 45	40 – 70	65 – 110	105+
Black Spruce	0 – 12	10 – 30	25 – 45	40 – 70	65 – 110	105+
White Spruce	0 – 10	8 – 20	15 – 40	35 – 60	55 – 110	105+
White Pine	0 – 12	10 – 30	25 – 50	45 – 90	85 – 160	155+
Jack Pine	0 – 10	8 – 20	15 – 40	35 – 70	65 – 110	105+
Red Pine	0 – 10	8 – 20	15 – 40	35 – 70	65 – 110	105+
Eastern Cedar	0 – 12	10 – 30	25 – 45	40 – 70	65 – 110	105+
Eastern Hemlock	0 – 12	10 – 30	25 – 50	45 – 90	85 – 140	135+
Larch	0 – 10	8 – 20	15 – 45	40 – 70	65 – 110	105+
Tolerant Hardwoods	0 – 12	10 – 30	25 – 50	45 – 80	75 – 160	155+
Red Maple	0 – 12	10 – 25	20 – 45	40 – 70	65 – 110	105+
Intolerant Hardwoods	0 – 10	8 – 20	15 – 35	30 – 50	45 – 70	65+
Grey Birch	0 – 8	5 – 15	10 – 25	20 – 40	35 – 50	45+

R Regenerating – A stand that has received a renewal of a forest crop by natural or artificial means. Trees are less than 3 meters in height with no merchantable volume present.

S Sapling – A forested stand whose trees are between two and seven meters tall and have a DBH between 1.0 cm and 9.0 cm but have not yet accumulated any merchantable volume.

Y Young – A forested stand which has grown past the sapling stage and is accumulating merchantable volume at a rapid rate. The majority of stems at this development stage have a DBH > 9.1 cm.

I Immature – A forested stand which is accumulating merchantable volume at a reasonable rate but is older and approaching maturity. Significant merchantable volume is present.

M Mature – A forested stand which is no longer accumulating merchantable volume, but is stable because growth and mortality are about equal. Significant volume is again present at this stage.

O Overmature – A forested stand which is losing merchantable volume at a rapid rate due to natural mortality.

A2.8 Wetland (WL) classification coding system

Water Regime Indicator (WRI)		Impoundment Modifier (IM)	
PF	Permanently Flooded	BP	Beaver Pond
SF	Seasonally Flooded	MI	Man-made Impoundment
SA	Saturated	DI	Ducks Unlimited Impoundment
TD	Tidal		
Vegetation Cover Type (VT)		Vegetation Cover Type (VT)	
OV	Open Water Vegetated	EV	Emergent Vegetation
OW	Open Water Unvegetated	FS	Forested Softwood Vegetation
FU	Feature Unvegetated	SV	Shrub Vegetation, except alders
AW	Alders	FH	Forested Hardwood Vegetation
FV	Feature Vegetated		

A2.9 Forest attributes FST 1, FST 2, FST 3 definitions
